

Structural, Non-Structural and Hybrid Options for Shoreline Protection

Dr. Mary Blickenderfer

UNIVERSITY OF MINNESOTA
EXTENSION

The natural shoreline “big picture”

**Protect
bank
from
wave
action**

**Deep
roots
bind
the
soil**

**Reduce run-off and
pollutant inputs
from the land**

Plants provide critter habitat

Shoreline Erosion Control “System”

Aquatic – Toe – Wetland

Wave Break

- Brush bundle
- Wrapped bundle
- Tree revetment
- Coco log
- Rock berm

Emergent Aquatic Plants

- Containerized plants
- Prevegetated mats
- In-lake transplants

Exclosure

- Fence/posts

Toe Protection

- Brush bundle
- Wrapped bundle
- Coco log
- Flax log
- Photo-bag/corn bale
- Coco lift
- Vegetated geogrid
- Geo-bag/soil
- Stump revetment
- Tree revetment
- Log raft
- Gabion tube
- Rock riprap

Wetland Plants

- Seeded plants
- Live stakes
- Live posts
- Live fascines
- Willow wattles
- Brush mattresses
- Bare root shrubs
- Plant plugs
- Containerized plants
- (Erosion blanket)

Site evaluation

- What indicators do we use to predict soft armor/bioengineering success?

Photo: Bill Bartodziej

Photo: Greg Berg

Plant selection and sequencing

- Plant rhizomatous species first
- Add showy, clump-formers later

Rhizomatous Plants

Sedges
(*Carex* spp.)

Bill Bartodziej

Bulrush
(*Schoenoplectus* spp.)

Bur-reed
(*Sparganium* spp.)

Bulrush
(*Bolboschoenus* spp.)

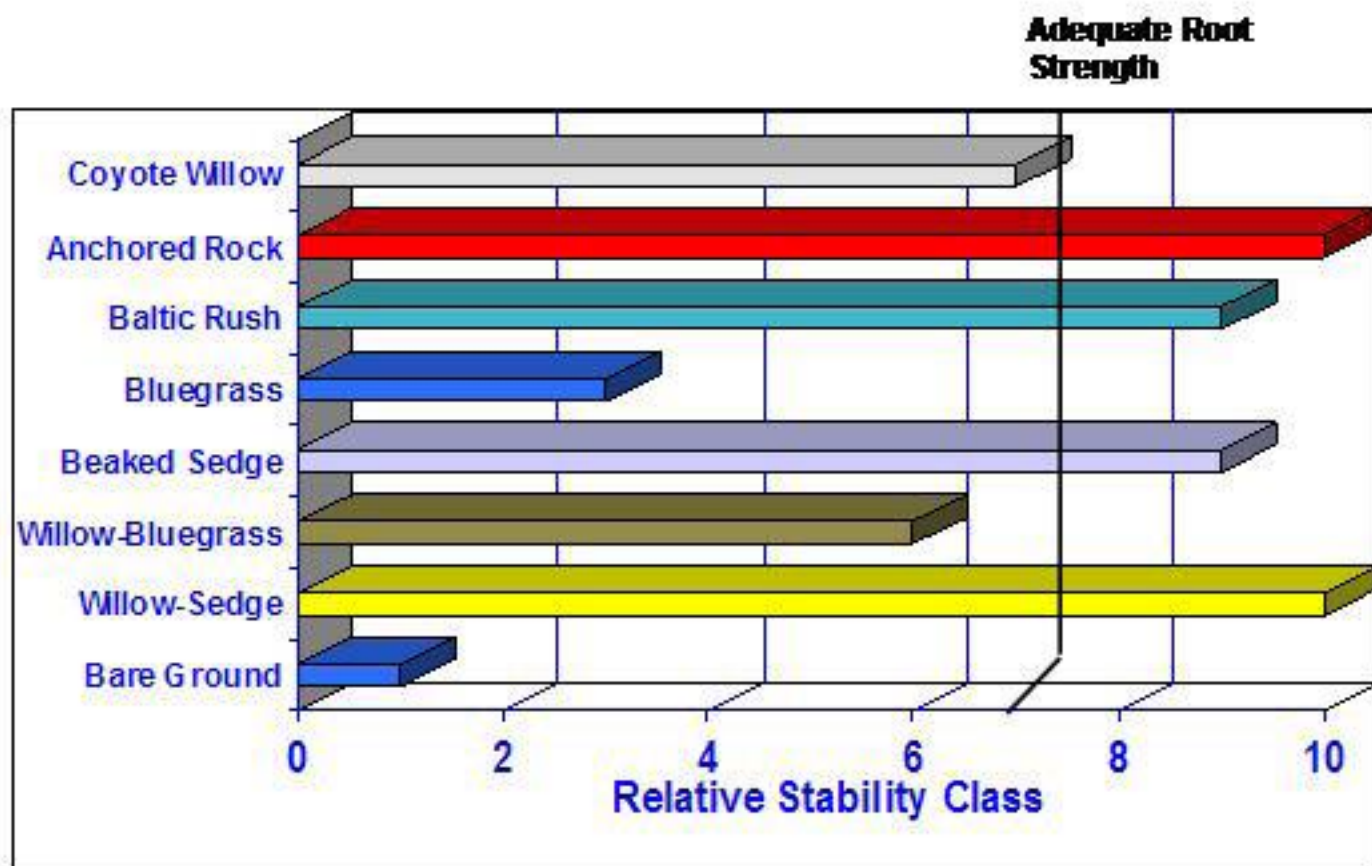

Root Length

Manning, M.E., et al, 1989

Erosion Control

Channel Stability Rating (Vegetation)

Bioengineering Methods

- Which bioengineering products, techniques and combinations will succeed?
- (U of MN research 2009-2012)

Bio products
have a
limited
lifespan...
plan for it!

Coco log (toe protection)

Wrapped brush bundle
(wave break)

For shorelines with little/no erosion:

Maintain or enhance native vegetation

For shores undercut up to 2 ft:

Install toe protection and native plants

Upland and wetland native plants - plugs and containerized

Cost/20 linear ft: \$200 (10 ft wide)
Installation time: 0.5 hr
Maintenance time: watering yr 1
Notes:

Live stakes and posts

Greg Berg – Stearns SWCD

Cost/20 linear ft: \$0
Installation time: 0.5 hr
Maintenance time: 0 hr
Notes:

For Toe Protection: bio logs

Gregg Thompson - AMSWCD

Cost/20 linear ft: \$150

Installation time: 0.5 hr

Maintenance time: 0

Notes: combine with plantings

Brush bundles

Swarming Along the River Bank Like Ants, Coolies Drag Long Strands of Woven Willow Sticks to the water's edge. Others carry packs of kaoliang stalks to the water's edge. Both materials rot in the water after a few years. Then new stacks are placed on top of the decayed mass into the mud on the river bottom. Often the entire construction is destroyed when the current scours out the river bed.

Wrapped bundles

Photodegradable bag/corn bale

Cost/20 linear ft: \$1,160

Installation time: included

Maintenance time: 0

Notes: installed only by trained contractor; last only 1 yr in high energy site

Stump revetment

Cost/20 linear ft: \$140 (hauling)
Installation time: included
Maintenance time: 0
Notes: installed by contractor;
used for traffic control

Aquatic emergent plants

Remember: Obtain a DNR permit before planting below the OHW

**Cost/20 linear ft: \$0-200
Installation time: 0.5 – 1 hr
Maintenance time: 0 hr
Notes: critter protection?**

Planted shores may require temporary **Wave Break** using a coco log or...

Figure 16-56 Coconut fiber roll details

Cross section
Not to scale

Cost/20 linear ft: \$150
Installation time: 0.5 hr
Maintenance time: 0 hr
Notes:

Note: Wave breaks, aquatic and wetland plants, and toe protection can “collect” suspended sediment and help rebuild the shoreline lost to erosion, as well as protect it from future erosion.

...cedar trees or brush bundles

Cost/20 linear ft: \$20
Installation time: 0.5 hr
Maintenance time: 0.5 hr
Notes: remove prior to freeze-up?

Cost/20 linear ft: \$60
Installation time: 1 hr
Maintenance time: 0
Notes: sediment collects between/behind bundles

Coco log and wrapped
brush bundle

Post Planting

Gregg Thompson - AMSWCD

First spring after planting

Gregg Thompson - AMSWCD

First summer after planting

Gregg Thompson - AMSWCD

Second summer after planting

Gregg Thompson - AMSWCD

Tree revetment, bio log, live stakes –
post installation

Gregg Thompson - AMSWCD

They may also need an **exclosure**
(a fence to protect the plants from critters)

Gregg Thompson - AMSWCD

Cost/20 linear ft: \$55
Installation time: 1 hr
Maintenance time: 0.5 hr
Notes: remove prior to freeze-up?

For shores undercut 2 to 4 ft

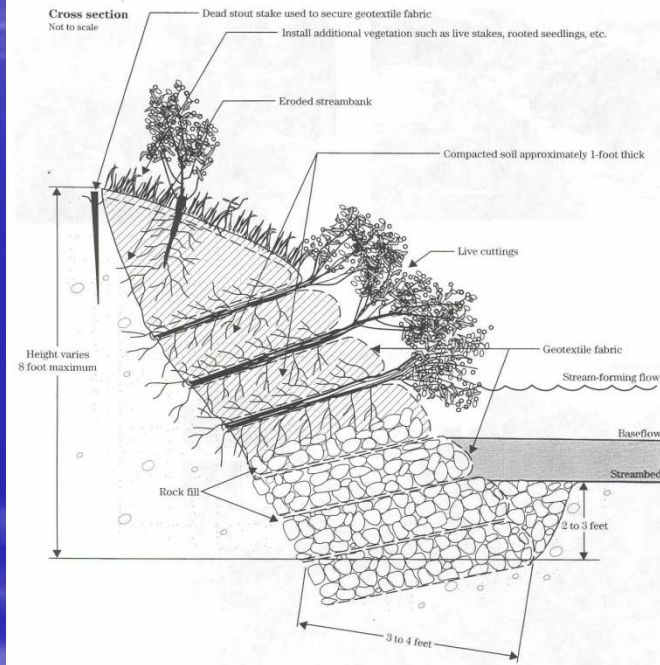

Install toe/slope protection and native plants

Vegetated geogrid

Note: Requires a shoreland alteration permit

Figure 16-12 Vegetated geogrid details

Cost/20 linear ft: ~\$400 (by hand)

Installation time: 5 hrs

Maintenance time: 0

Notes: requires dormant live stakes

Coco lift

(with live stakes & plants)

Note: may require a shoreland alteration permit

**Cost/20 linear ft: \$340
Installation time: 5 hrs
Maintenance time: 0
Notes: requires plants and/or live stakes**

Oops!

Retaining wall is not such a good idea

Geosynthetic bag/soil

Shape slope, blanket, plant

**Note: requires a
shoreland
alteration permit**

**Cost/20 linear ft: \$1,000
Installation time: 3 hrs
Maintenance time: 1 hr
Notes: requires equipment**

For shores with erosion bank > 4 ft:

Greg Berg – Stearns SWCD

Shape slope, blanket, plant

Greg Berg – Stearns SWCD

Cost/20 linear ft: \$1,500
Installation time: 6 hrs
Maintenance time: 1 hr
Notes: requires equipment

Note: requires a shoreland alteration permit

Greg Berg – Stearns SWCD

Tree Revetment

Cost/20 linear ft: \$50
Installation time: 0.5 hr
Maintenance time: 0
Notes: use duck-bill anchors

Greg Berg – Stearns SWCD

Live fascines

Greg Berg – Stearns SWCD

Live fascines 5 yrs after installation

Rock rip rap & native plants

Figure 12: Live stakes installed through rip-rap.

Cost/20 linear ft rip rap: \$1,200
Installation time: included
Maintenance time: varies
Notes: installed by contractor

Project Examples

Little Bass Lake

- Small lake
- Small resort
- Upland and aquatic vegetation removed on 400' of shoreline; turf seeded on upland
- Shore eroding 6"/year; 1-2' undercut toe
- Owner preference: "My customers come to the north woods - give them the north woods"
- Total cost: \$800 (\$2.00/linear shoreland foot)

Aerial view

Before planting

Install willow wattle
along eroding shore

Install coconut log – note sedge transplant after only one year

Install aquatic and upland plants

Shoreline after
two years

Shoreline five years after planting

Snake River

- Private owner (4 years)
- 400' shoreline on narrow channel
- Shore eroding 6"/year
- Boat traffic; seasonal flooding; muskrats
- Project cost: \$5,000 (\$12.50/linear shore ft.)
 - Coco logs, coco blankets, stakes, mulch
 - Plants

Lay out site

Apply mulch for
weed control

- C-125 coco blanket to hold mulch in place during floods

Native plant plugs on
1.5' centers

Coco log wave break

Prevegetated plant
mats

Continuous row
(on 2' centers)

5 species

After installation

One year post-installation

McCarrons Lake

68 acres – heavy boat traffic

Site on west side – maximum fetch = 3,000 ft

Shallow water zone – 1ft depth out 10 ft from shore

All photos in this sequence provided by Bill Bartodziej - RWMWD

Wall and turf removed

Shore regraded

Coconut logs staked on top of the NAG C-350

Soil over NAG C-350, seeded, and then covered with C-125

Plants are installed through the erosion C-125 blanket @ 1.5 ft centers

Emergents – mainly bulrush, some arrowhead and pickerel plant – 1 gallon containers @ 3-4 ft centers

September 2004

Summer 2005

Shoreline becoming well established, emergents set back by muskrats and waves

Summer 2006 – Shore stable - Lake sedge enveloping the coconut logs

Summer 2006

What would we do differently?

- Use wave breaks in front of emergents
- Plant a higher percentage of burreed – more resistant to muskrat feeding
- Probably would not need NAG C-350 at the toe of the slope if emergents became well established

Take-home messages:

- The goal is to recreate a gradually sloping shoreline stabilized with native plants
- It is possible on some sites to “reclaim” lost shoreline
- On extreme sites bioengineering may be very costly and/or ineffective

Take-home (continued)

- Use components of the “system” that are site appropriate
- Inert bio materials have a limited lifespan – make sure you choose plants that will stabilize the site within this time
- Never underestimate the appetite of muskrats, carp, geese, beavers etc.
