# Sediment Relationships to EWM

(Paul Skawinski - UW-Stevens Point)

# Purpose of this Study

- Relationships are largely unknown
    - EWM vs. *Euhrychiopsis lecontei* weevils
    - EWM vs. sediment nutrients
    - EWM vs. shoreline characteristics
- Can these variables predict how susceptible a lake is to EWM invasion?

# Project Scope

- 15 study lakes
  - Selected from DNR's Long Term Trends (LTT) lakes
  - No active management of EWM
  - Two lakes decided to do herbicide treatments in spring 2011 and were dropped from the study
  - Two replacement lakes will be added for 2012 season

# Study Lakes

- **Ivanhoe** (Walworth);
- **Gibbs** (Rock);
- **Wingra, Fish** (Dane);
- **Crystal** (Marquette);
- **Joanis, Thomas, Emily** (Portage);
- **Bear Paw** (Oconto);
- **Montana** (Marinette);
- **Manson, Hancock, Little Bearskin** (Oneida);
- **Round** (Burnett);
- **Bass** (St. Croix)

# Weevil Stocking/Efficacy

(Susan Knight – UW Trout Lake Station)

- 7 lakes in northern Wisconsin
  - Boot (Vilas); Frog, Seidel, Long (Florence); Little Bearskin, Manson (Oneida)
  - 2012: Whole-lake PI surveys, stock weevils into two randomly selected beds in 6 of 7 lakes.
  - 2013-2015: Monitoring. Whole-lake PI surveys, weevil density surveys, and addition of more weevils if recommended.

# Weevil Rearing

(Amy Thorstenson - Golden Sands RC&D)
