

# ZONING AS A TOOL IN GROUNDWATER PROTECTION

JANUARY 4, 2022

CENTRAL SANDS GROUNDWATER COLLABORATIVE

LYNN MARKHAM, LAND USE SPECIALIST

Center for Land Use Education  
College of Natural Resources  
**University of Wisconsin - Stevens Point**

**Extension**  
UNIVERSITY OF WISCONSIN-MADISON

# SUMMARY

- Zoning has strengths and weaknesses related to protecting groundwater
- Weaknesses
  - Limited ability to address existing problematic land uses
  - Zoning doesn't determine which crops are grown in ag districts, even though they have different amounts of nitrogen leaching to groundwater
- Strengths
  - Can use wellhead protection ordinances to protect municipal/community wells
  - Can set minimum lot sizes to space out residential septic systems and protect private well water quality from septic systems
  - Can list high nitrogen uses as conditional or prohibited uses (e.g. fertilizer plants, landfills, feedlots, cemeteries, golf courses, possibly CAFOs)
  - Can geographically separate high nitrogen uses from wells - theoretically
- Can be changed at any time by elected officials (town-county zoning). Land purchases are more certain long-term protection, and more expensive.

Comprehensive plan = Goals

Zoning = Way to achieve goals

# Guiding Document

**Comprehensive Plan**

## Regulatory Tools to Implement the Plan

**Zoning Ordinance**

**Subdivision Ordinance**

## Protecting Wisconsin's Groundwater Through Comprehensive Planning

*The drinking water in over 95% of Wisconsin's communities is groundwater. Public health and strong local economies depend on wise local decisions regarding groundwater.*

*This web site will help you learn about groundwater, find groundwater data and polices, and plan to protect groundwater in your area.*

- LEARN MORE ABOUT GROUNDWATER
- INTEGRATE GROUNDWATER INTO YOUR PLAN
- FIND DATA AND POLICIES IN YOUR AREA
- BROWSE ADDITIONAL RESOURCES

Policy suggestions for updating comp plans.  
Note: Data on this website is old. Use Well Water Quality Viewer for data.

# EXAMPLE OF USING YOUR PLAN TO PROTECT GROUNDWATER

- Plans are only valuable if they are used in making decisions
- Changes to zoning are required to be consistent with the comprehensive plan
- Portage County used their comp plan to guide groundwater protection conditions for a new proposed development that required a change in zoning

### Proposed FLU Changes

- Change from L1 to L3
- Change from L1 to Industrial
- Change from L1 to Residential

### Proposed Future Land Use Changes

1 in = 208 feet

INQUIRER: Jaime White for Storage Unlimited  
 LOCATION: 1322 Stockton Rd, Town of Stockton  
 DESCRIPTION OF REQUEST:

# WHAT DO ZONING AND SUBDIVISION REGS DO?

- Sets the development pattern
  - Density
  - Land Uses
  - Building envelope dimensions (setbacks, height, etc.)
  - Roads
- Impacts how our communities look and how they function

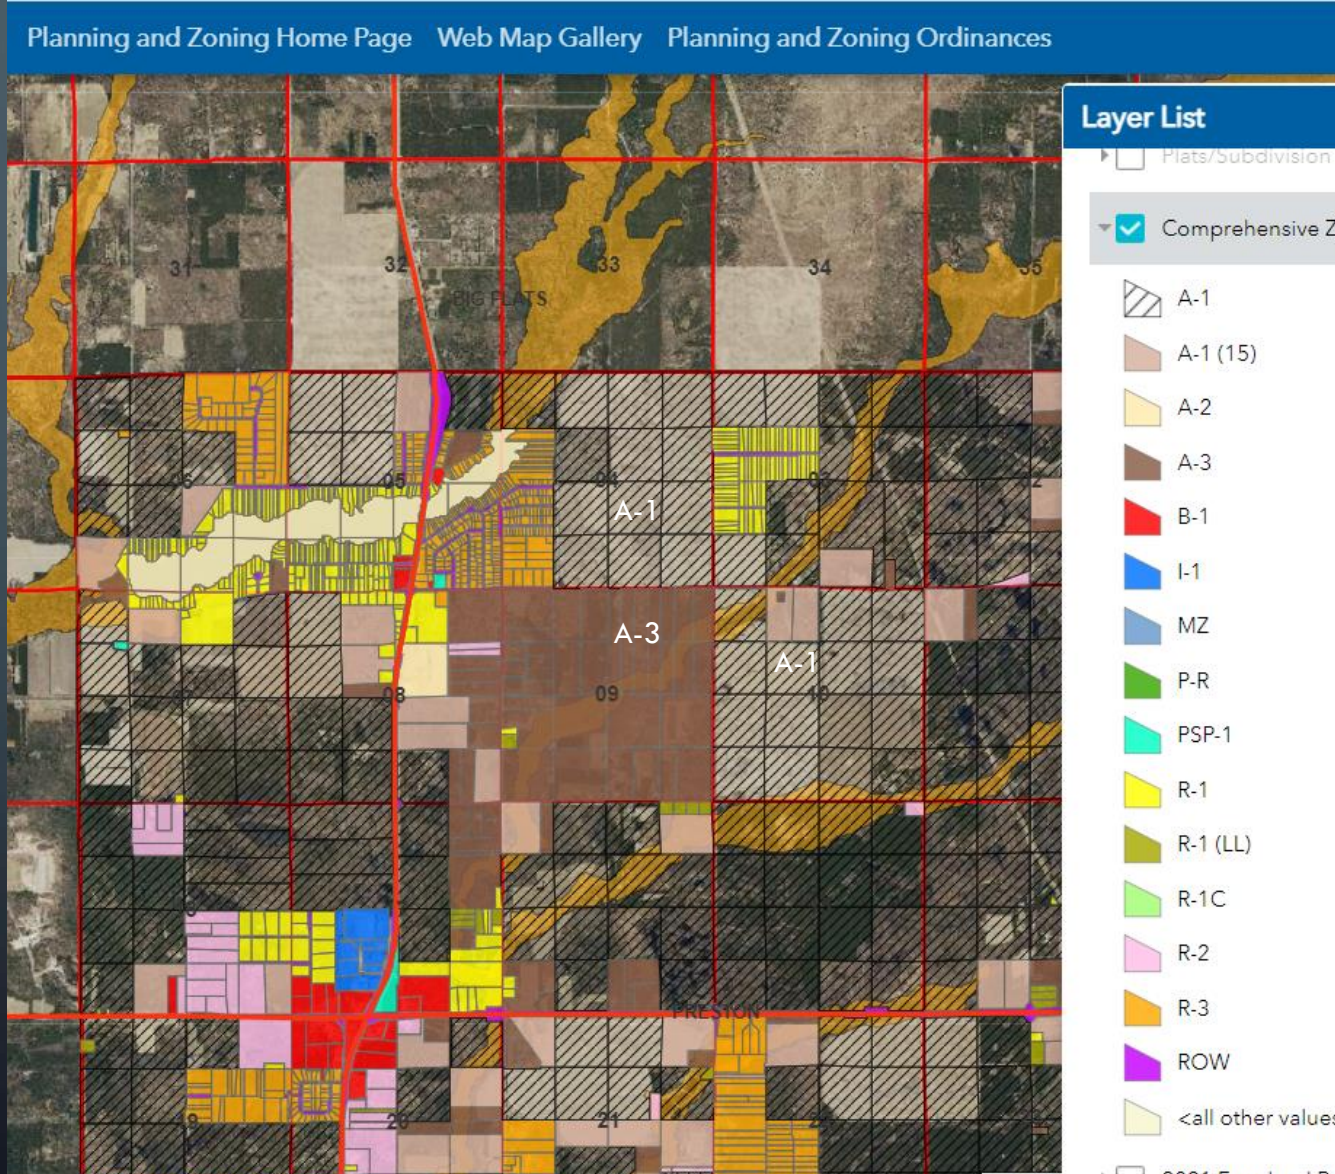

The image features a dark blue background with white, stylized circuit board traces in the corners. These traces consist of straight lines that turn at right angles and terminate in small circles, resembling electronic components or nodes on a board. The traces are located in the top-left, top-right, bottom-left, and bottom-right corners, framing the central text.

# HOW DOES ZONING WORK?

A zoning ordinance contains two parts:

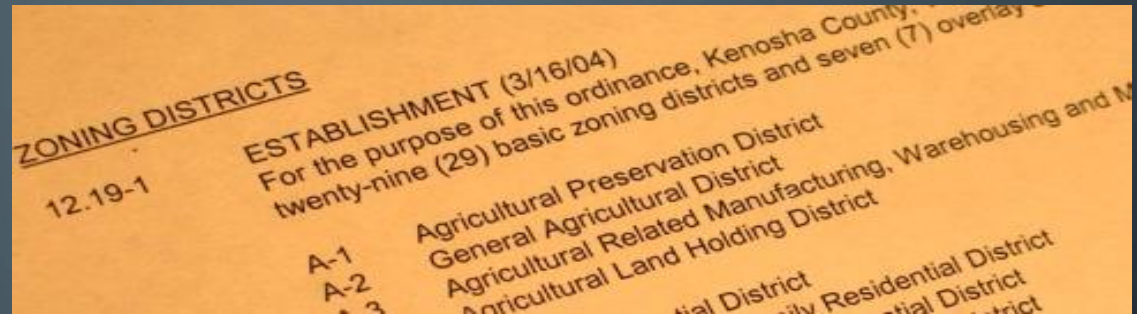

Zoning Map  
divides the  
community into  
districts

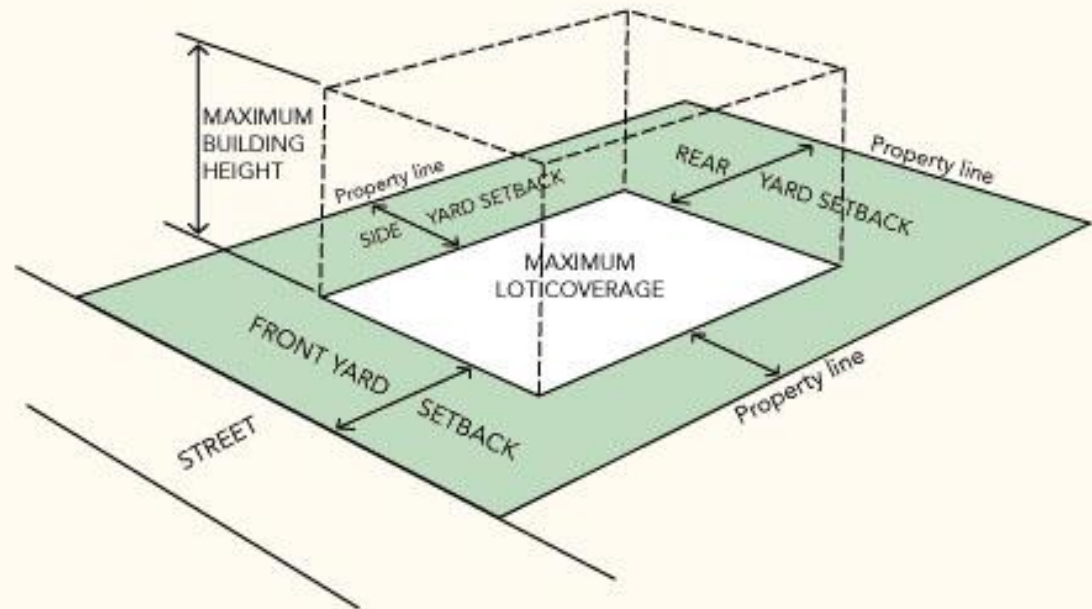

# A zoning ordinance contains two parts:

## Zoning Text

- purposes
- uses allowed in each district
- dimensional standards i.e. lot size, setbacks, etc.
- requirements related to parking, signage, landscaping, etc.

### Building Envelope

# USES FOR EACH DISTRICT:

## Permitted Use

Use is listed and allowed by right in all parts of the zoning district

Granted by zoning administrator

## Conditional Use

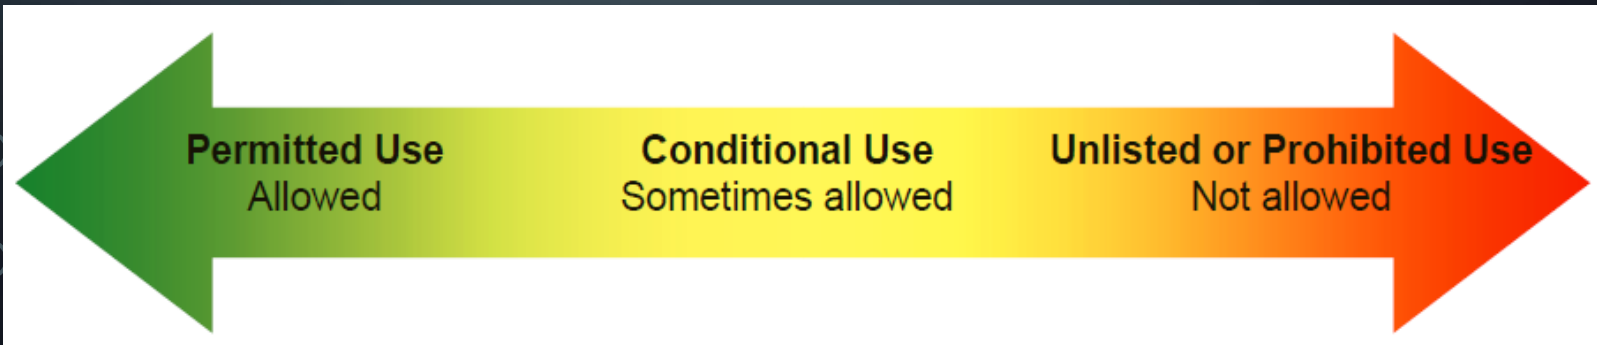

Use is listed for the district and may be allowed if suited to the location

Decided by zoning board, plan commission, or governing body

## Prohibited Use

Use is not listed for the district or is expressly prohibited

May apply for rezone or use variance, if allowed

# COUNTY SURVEY RESULTS

|  | Adams   | Juneau | Marquette                                      | Portage  | Waushara   | Wood                                    |
|--|---|--------|--|--|--|---|
| Which towns have county zoning?  | Most  | None   | Most   | Most   | Most   | All. 11/21 towns also have town zoning. |
| Large residential lot sizes that limit septic system density and nutrient loading? | At least one residential zoning district with a lot size $\geq 2$ acres (R1 & R2)   | N/A    | No. Ag districts have lot sizes $\geq 2$ acres | At least one residential zoning district with a lot size $\geq 2$ acres (Rural & Urban Fringe) | At least one residential zoning district with a lot size $\geq 2$ acres (Residential Single-Family Planned Devt) | No minimum lot sizes in county zoning   |
| Comments   | <ul style="list-style-type: none"> <li>• How widely do residential zoning districts with a minimum lot size 2 acres or greater apply in your county? What percentage of residentially zoned areas have minimum lot sizes 2 acres or greater?</li> <li>• Where residential zoning districts have lot sizes 2 acres or greater, drinking water quality should be <u>fairly well</u> protected from nearby septic systems. Ag or other land uses applying nitrogen may still affect drinking water quality in residential zoning districts with minimum lot sizes 2 acre or greater.</li> <li>• Large residential lot sizes also take more farmland and woodlands out of production. An alternative is to guide new residential development to villages/hamlets with public water and sewer to provide safe drinking water. Jefferson County uses this approach to an extent.</li> <li>• Most ag districts have lot sizes greater than 2 acres, though some ag districts and <u>general purpose</u> districts have minimum lot sizes less than 2 acres and allow residential development (e.g. Waushara, Marquette, Town of Rudolph).</li> </ul> |        |  |  |  |   |

# DIFFERENT CROPS LEACH DIFFERENT AMOUNTS OF NITROGEN TO GROUNDWATER

- Ag zoning districts do not differentiate based on how much nitrogen is leached to groundwater

$$\text{N Inputs} - \text{N Outputs} - \text{N Storage} = \text{Leachable N}$$

| Crop                            | Yield (per acre) | Inputs     |                         |                    | Outputs         |              | Storage     | Leachable Nitrogen |
|---------------------------------|------------------|------------|-------------------------|--------------------|-----------------|--------------|-------------|--------------------|
|                                 |                  | Fertilizer | Irrigation <sup>1</sup> | Precip+ Deposition | Harvest Yield N | Misc. losses | Change in N |                    |
| -----lbs nitrogen per acre----- |                  |            |                         |                    |                 |              |             |                    |
| Potato                          | 424 cwt          | 220-300    | 41                      | 8                  | 170             | 30-37        | 0           | 72-144             |
| Sweet Corn                      | 8.5 ton          | 130-170    | 41                      | 8                  | 73              | 22-25        | 0           | 86-123             |
| Field Corn                      | 204 bu           | 180-240    | 41                      | 8                  | 149             | 26-32        | 0           | 56-110             |
| Carrots                         | 27 ton           | 100-140    | 41                      | 8                  | 97              | 19-23        | 0           | 35-71              |
| Snap Beans <sup>2</sup>         | 8 ton            | 40-80      | 41                      | 8                  | 62              | 14-17        | 0           | 15-51              |

Sandy soils.

<sup>1</sup>Assumes 10 inches of irrigation water containing 18 mg/L nitrate-nitrogen. At this concentration each inch of irrigation water contains 1.8 lbs nitrogen per acre.

<sup>2</sup>Non-nodulating

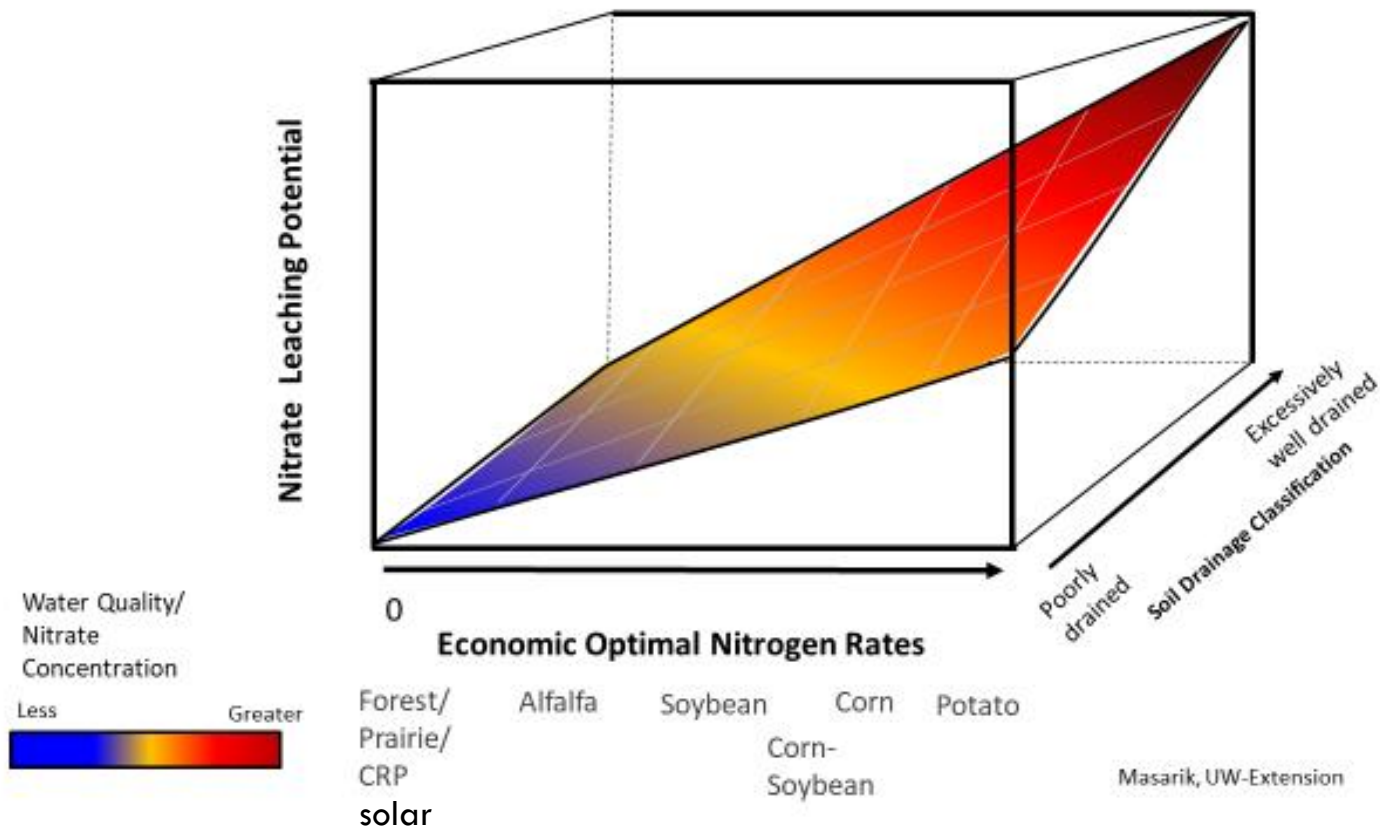

# Comparing Land-use Impacts

*1 Data from Masarik, Economic Optimum Rate on a silt-loam soil, 2003*

*2 Data from Tri-State Water Quality Council, 2005 and EPA 625/R-00/008*

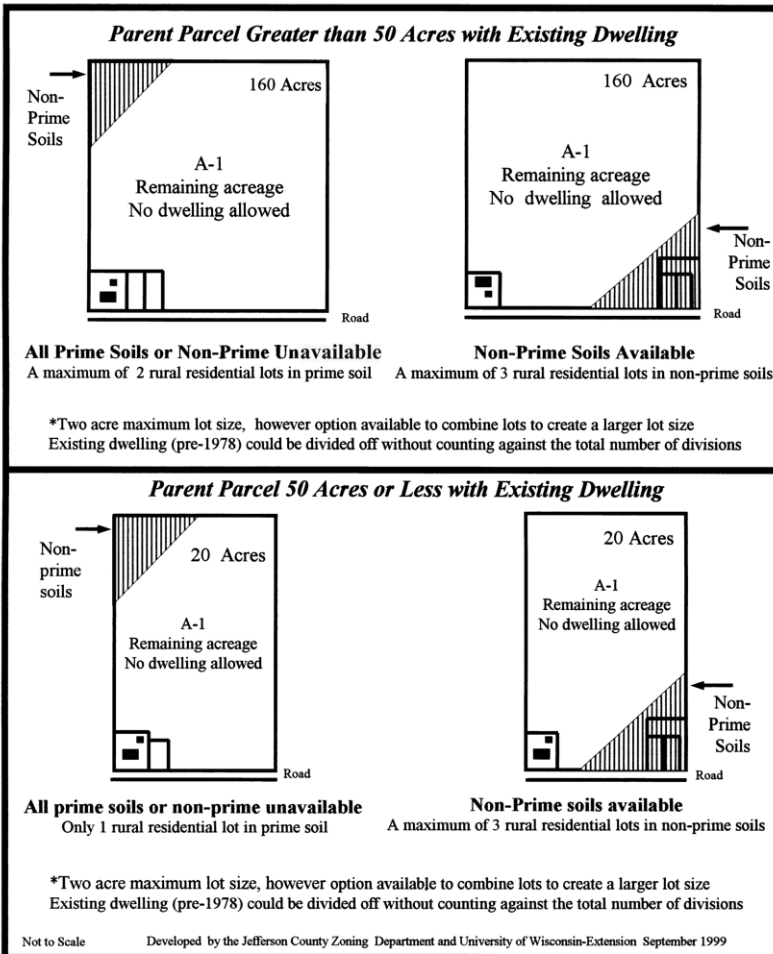

# Nitrate Leaching Potential

- Different crops on the same soil have different rates of nitrate leaching that vary from year to year based on fertilizer inputs, yield, and weather
- Nitrate leaching below the same crop can vary depending on soil type and location in the state
- Zoning doesn't determine which crops are grown. **LWCD and FSA offices can affect this topic.**

Kevin Masarik, Groundwater Specialist, send PowerPoint and video

## WHAT CAN I DO ON MY LAND AS A RESULT OF NEW POLICIES?

## LIMITED RESIDENTIAL ALLOWED IN A-1 ZONING DISTRICTS

- Farmland preservation
- Fewer new residential lots in A-1 zoning districts which may have high nitrate levels

# SURVEY RESULTS

Limiting new residential lots where drinking water is not safe

Do drinking water health standards such as 10 mg/l nitrate-nitrogen, pesticide standards, or other drinking water standards need to be met before subdividing land?

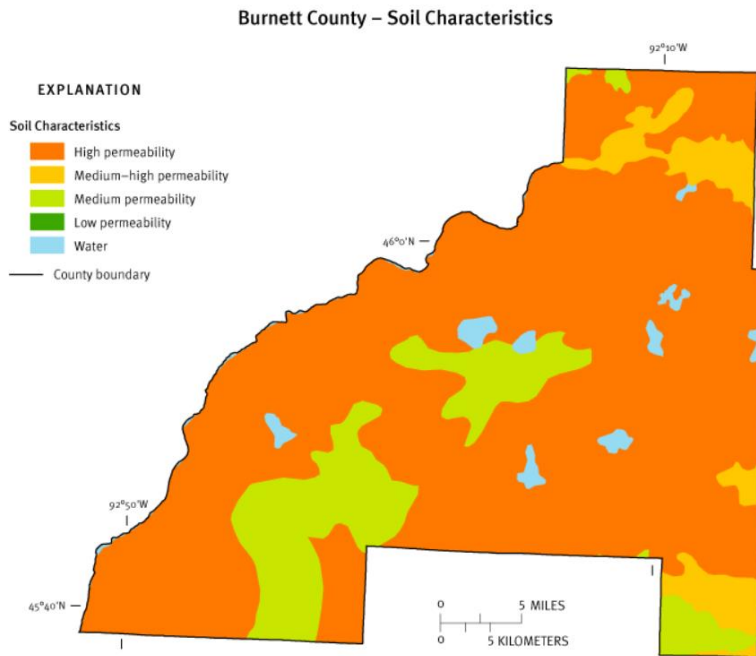

No for all counties except Portage. Portage Co has a subdivision ordinance that requires a water test prior to the division of land. However, it does not necessarily have to meet drinking water standards in order to be divided. Extremely elevated levels may prevent a property from being divided or may require notification be placed on the Certified Survey Map or treatment may need to be provided.

# CAN USE ZONING TO MAKE LAND USES WITH HIGH NITROGEN LEACHING CONDITIONAL OR PROHIBITED USES

|  | Adams  | Juneau | Marquette | Portage | Waushara | Wood |
|--|--|--------|-----------|---------|----------|------|
| Are land uses with high potential to contaminate drinking water prohibited or restricted in areas with drinking water wells? | <p><b>Conditional uses:</b> Fertilizer plants, feedlots, gas stations. Require a public hearing to decide whether to grant or deny depending on if standards are met, including impacts on adjacent properties.</p> <p><b>Permitted uses:</b> Ag uses, golf courses and cemeteries. Allowed.</p> <p><b>Comment:</b> Portage Co has GW flow maps, depth to GW, irrigated fields, water quality viewer, locations of wells and <u>septics</u>.</p> |        |           |         |          |      |

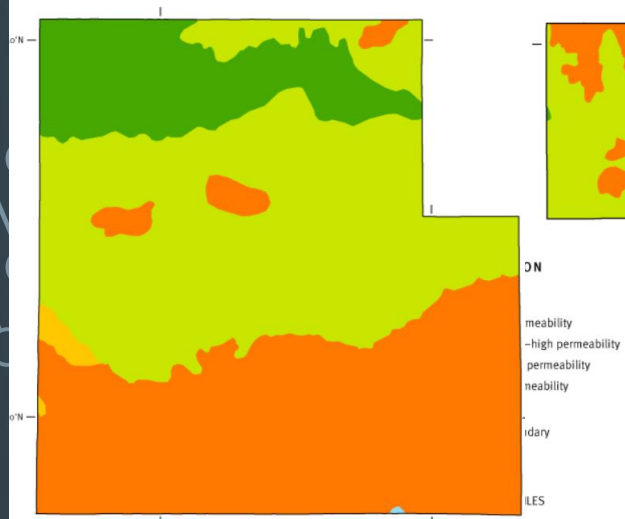

- Review the permitted, conditional, and unlisted/prohibited uses listed for each zoning district in your ordinance. Compare your zoning maps with your groundwater susceptibility/soil maps. Do they need to be updated to protect groundwater quality?
- 2017 Act 67 says if a CUP meets standards in ordinance it must be granted

## BURNETT COUNTY PLANS TO USE GW SUSCEPTIBILITY MAPS AND ZONING TO LIMIT WHERE NEW CAFOS CAN BE LOCATED

- About 80% of Burnett County is less than 20 feet to the water table and has highly permeable soils
- Burnett County has three ag districts
- Not much exclusive ag zoning (A1) is located in the sandy soil areas of the county
- Land use committee is working on a proposal to allow CAFOs (1000 animal units or more) only in A1, and limit animal units in other ag districts to 250 or 500

Wood County – Soil Characteristics

Portage County – Soil Characteristics

- All counties in CSGCC have areas of highly permeable soils, and some areas with lower permeable soils
- Areas with lower permeable soils are likely safer places for land uses that are potential sources of GW contamination
- Zoning can be used to determine where NEW land uses will be located (e.g. fertilizer plant, manufacturing)

Juneau County – Soil Characteristics

Adams County – Soil Characteristics

Waushara County – Soil Characteristics

Marquette County – Soil Characteristics

# Comparing Land-use Impacts

20 acres

|        |        |        |        |
|--------|--------|--------|--------|
| 36 lbs | 36 lbs | 36 lbs | 36 lbs |
| 36 lbs | 36 lbs | 36 lbs | 36 lbs |
| 36 lbs | 36 lbs | 36 lbs | 36 lbs |
| 36 lbs | 36 lbs | 36 lbs | 36 lbs |
| 36 lbs | 36 lbs | 36 lbs | 36 lbs |
| 36 lbs | 36 lbs | 36 lbs | 36 lbs |

**36 lbs/ac x 20 acres = 720 lbs**

20 acres

|        |        |        |        |
|--------|--------|--------|--------|
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |
| 20 lbs | 20 lbs | 20 lbs | 20 lbs |

**20 lbs/septic system x 36 septic systems = 720 lbs**

**Using these numbers: 36 septic systems on 20 acres (0.55 acre lots) needed to achieve same impact to water quality as 20 acres of corn**

## UNSEWERED RESIDENTIAL AREAS

Figure 2. North study area showing land uses and density of homes in the residential areas. Numbered squares show location of private wells sampled and dark circles show the location of the monitoring wells.

- In a sandy area with unsewered lot sizes less than 2 acres, nitrate levels were:
  - 7 wells 2-10 ppm = blue circles
  - 3 wells over 10 ppm = black circles
  - 1 well less than 2 ppm
- Sulfamethoxazole, a human antibiotic = red circles
- Let me know if you'd like a copy of this study

## RESIDENTIAL ZONING FOR UNSEWERED DEVELOPMENT

- Zoning can be used to set unsewered minimum residential lot sizes at 2 or more acres to limit well contamination by nitrate and pharmaceuticals from nearby septics

# Wellhead protection ordinance

# SURVEY RESULTS

|   | Adams | Juneau              | Marquette | Portage   | Waushara | Wood   |
|---|-------|---------------------|-----------|---|----------|--|
| Do you have overlay districts to reduce groundwater contamination? This might include districts to protect municipal wells, wells for trailer courts, or other wells. | No    | N/A for county regs | No        | Wellhead protection overlay for <u>muni wells</u> | No       | Wellhead protection overlays for <u>muni wells</u> in <u>WI Rapids, Marshfield and Pittsville?</u> Not for other 5 <u>munis.</u> |

ENVIRONMENT INVESTIGATES

## Ford megasite atop 'recharge zone' for underregulated Memphis Sands aquifer

An area that provides drinking water for more than a million people depends on company and state for protection

BY: ASHLI BLOW - JANUARY 3, 2022 5:01 AM

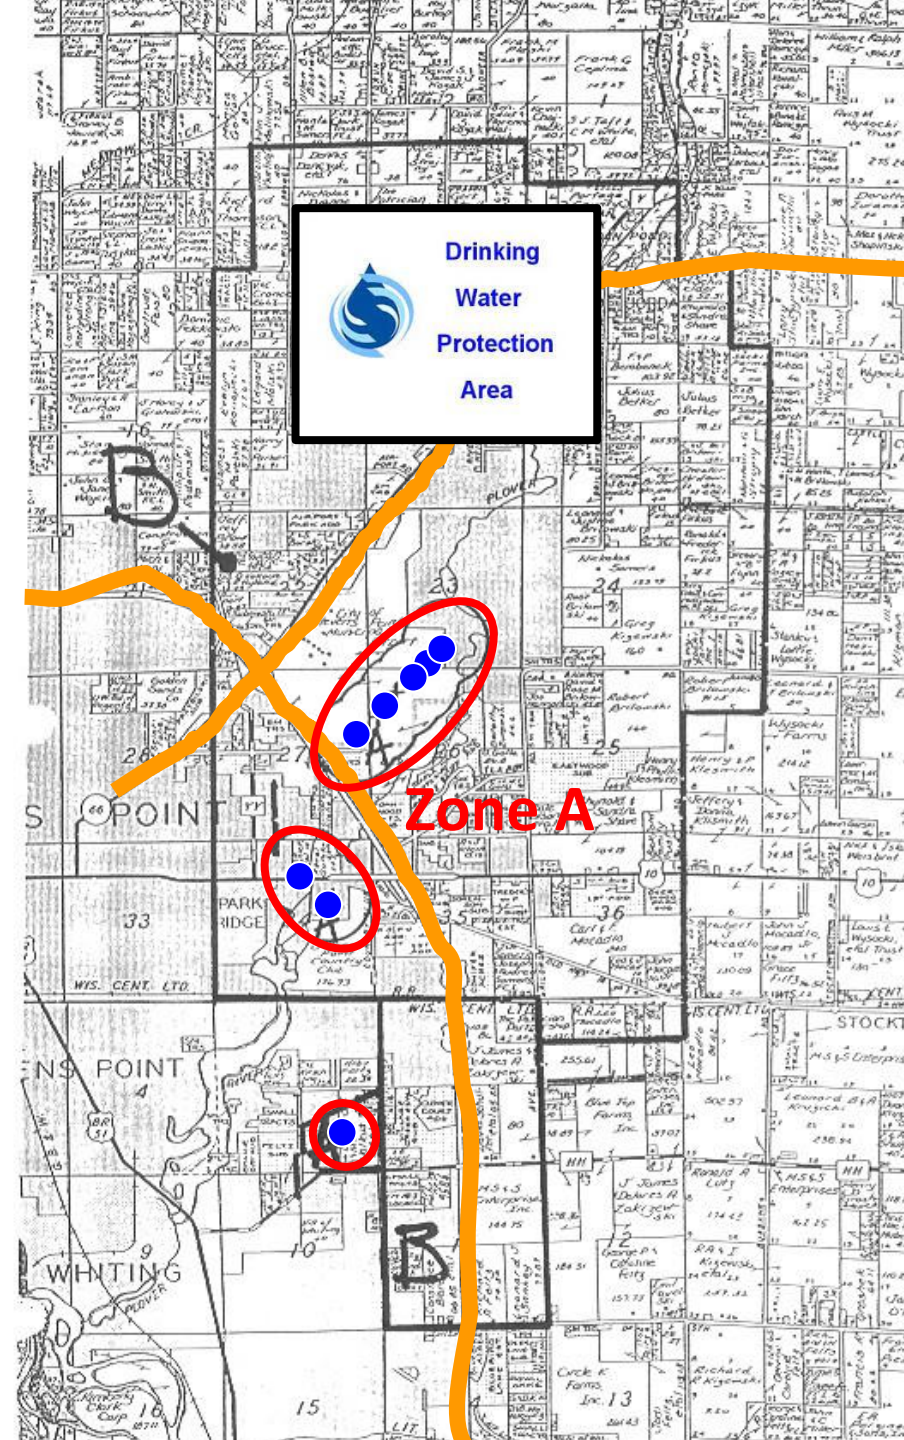

© Satellite image of a portion of the Megasite of West Tennessee. (Tennessee Department of General Services.)

# Wellhead Protection Ordinance

Zone A – allows only land uses with low potential to pollute drinking water such as unfertilized parks

Zone B – allows more land uses but not gas stations, fertilizer plants, cemeteries, etc.

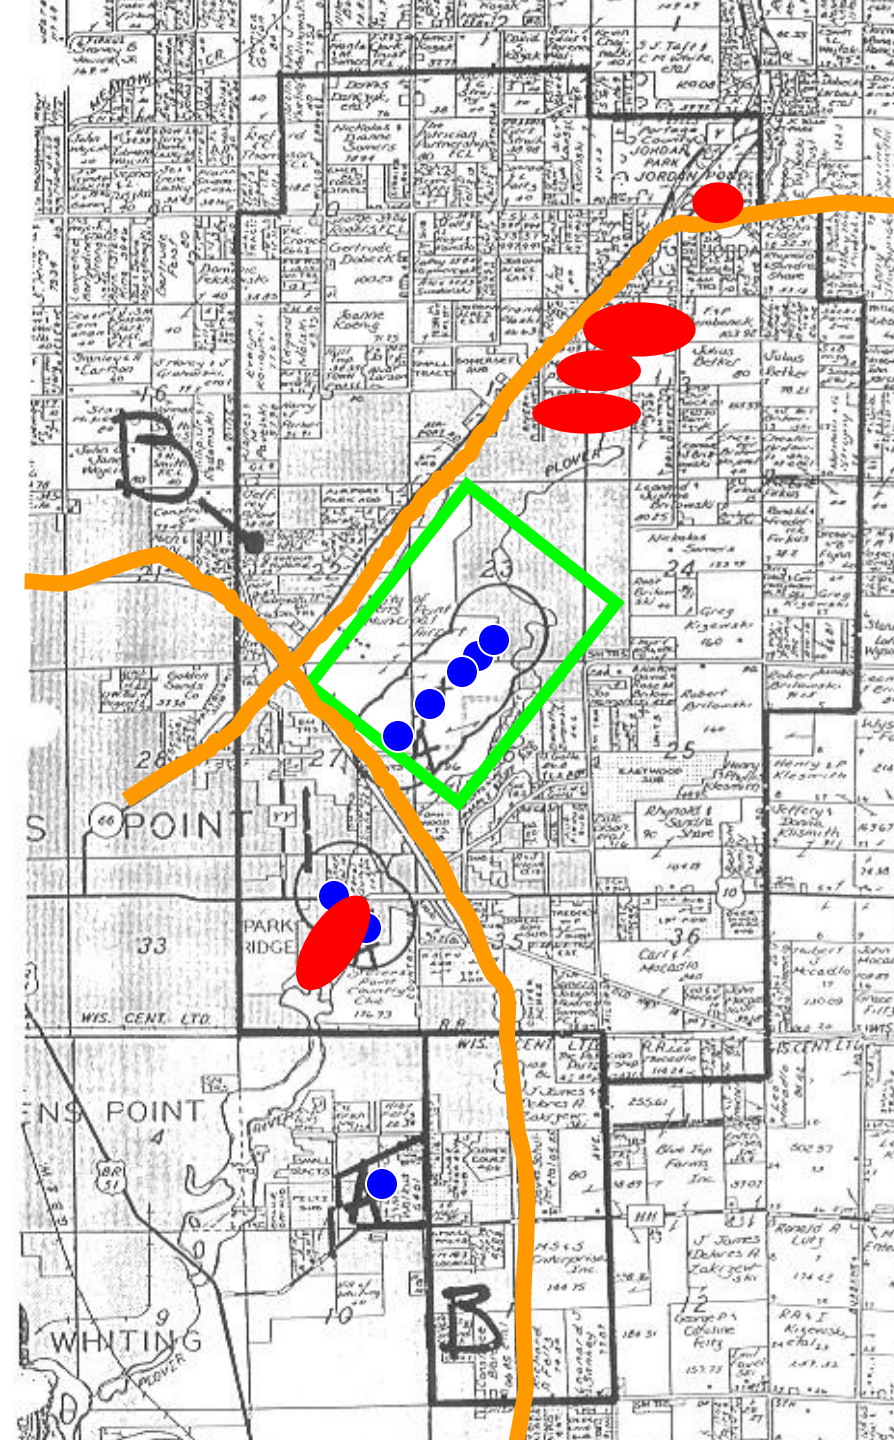

Municipalities can save \$ by keeping their drinking water safe

# Other approaches to wellhead protection

- Purchase and lease of lands around the wells:
  - City forested recreation area
  - Izaak Walton League lodge and shooting range
  - Boy Scout camp
  - Conservation easement

ARPA funding?

# SUMMARY

- Zoning has strengths and weaknesses related to protecting groundwater
- Weaknesses
  - Limited ability to address existing problematic land uses (e.g. fertilizer plant with regular spills); can limit building expansions
  - Zoning doesn't determine which crops are grown in ag districts, even though they have different amounts of nitrogen leaching to groundwater
- Strengths
  - Can use wellhead protection ordinances to protect municipal/community wells
  - Can set minimum lot sizes to space out residential septic systems and protect private well water quality from septic systems
  - Can list high nitrogen uses as conditional or prohibited uses (e.g. fertilizer plants, landfills, feedlots, cemeteries, golf courses, possibly CAFOs)
  - Can geographically separate high nitrogen uses from wells - theoretically
- Can be changed at any time by elected officials (town-county zoning). Land purchases are more certain long-term protection, and more expensive.
