

NSRS Modernization Updates from the National Geodetic Survey Part 2

WSLS Surveyors' Institute
January 27, 2021

Jacob M. Heck, Ph.D.
Great Lakes Regional Geodetic Advisor

Outline

- NGS Products and Services
- Updates on NSRS Modernization
- New types of coordinates
- New ways of working in the NSRS
- How you can contribute

NGS PRODUCTS AND SERVICES

NGS Products and Services help users access the NSRS

What “Access” to the NSRS Means

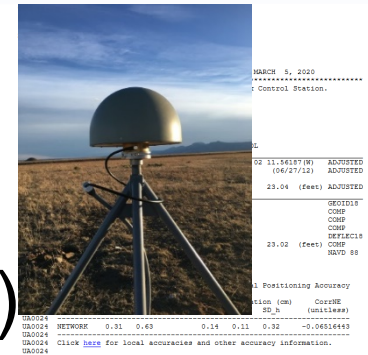

Until 1980, NGS offered “passive control”

- And one definitive coordinate set for each one
 - 1.6 M marks

More recently, NGS provides data and coordinate functions with NOAA CORS Network (most were not installed by NGS)

- And one definitive coordinate function for each one
 - And the software (PAGES / OPUS) to differentially position your GPS receiver to each station

What “Access” to the NSRS Will Mean

- Very similar *philosophically*:
 - The NSRS remains “geodetic control” for you to “access”
 - Geospatial information and metadata about various points
 - Passive control will exist...we aren't getting out bulldozers and shovels
 - But gone are the days of getting “the coordinate” on a point from a “datasheet”

What “Access” to the NSRS Will Mean

- Very different *practically*
 - Information: from the **Data Delivery System**
 - Graphics (pictures, graphs, maps)
 - Computations: **OPUS**
 - Do-it-all (mark reporting, positioning, adjustments, etc)
 - Heavy emphasis on using GNSS to get to the NSRS
 - All constellations will be supported
 - Real time helpful CORS information (data availability & quality)
 - Use new GNSS
 - Or, maybe, some “trusted” passive control
 - Otherwise, your preliminary coordinates may say “not NSRS coordinates”

OPUS

The Online Positioning User Service

- NGS will cease the expanding “hyphenated” versions
 - OPUS-Projects, OPUS-S, OPUS-RS, OPUS-Share, etc
- Will replace
 - All internal versions of OPUS
 - All user versions of OPUS
 - All forms of “Bluebooking”
 - Analyzing, adjusting, submitting geodetic survey data to NGS
- Mark Recovery and Reporting Tool

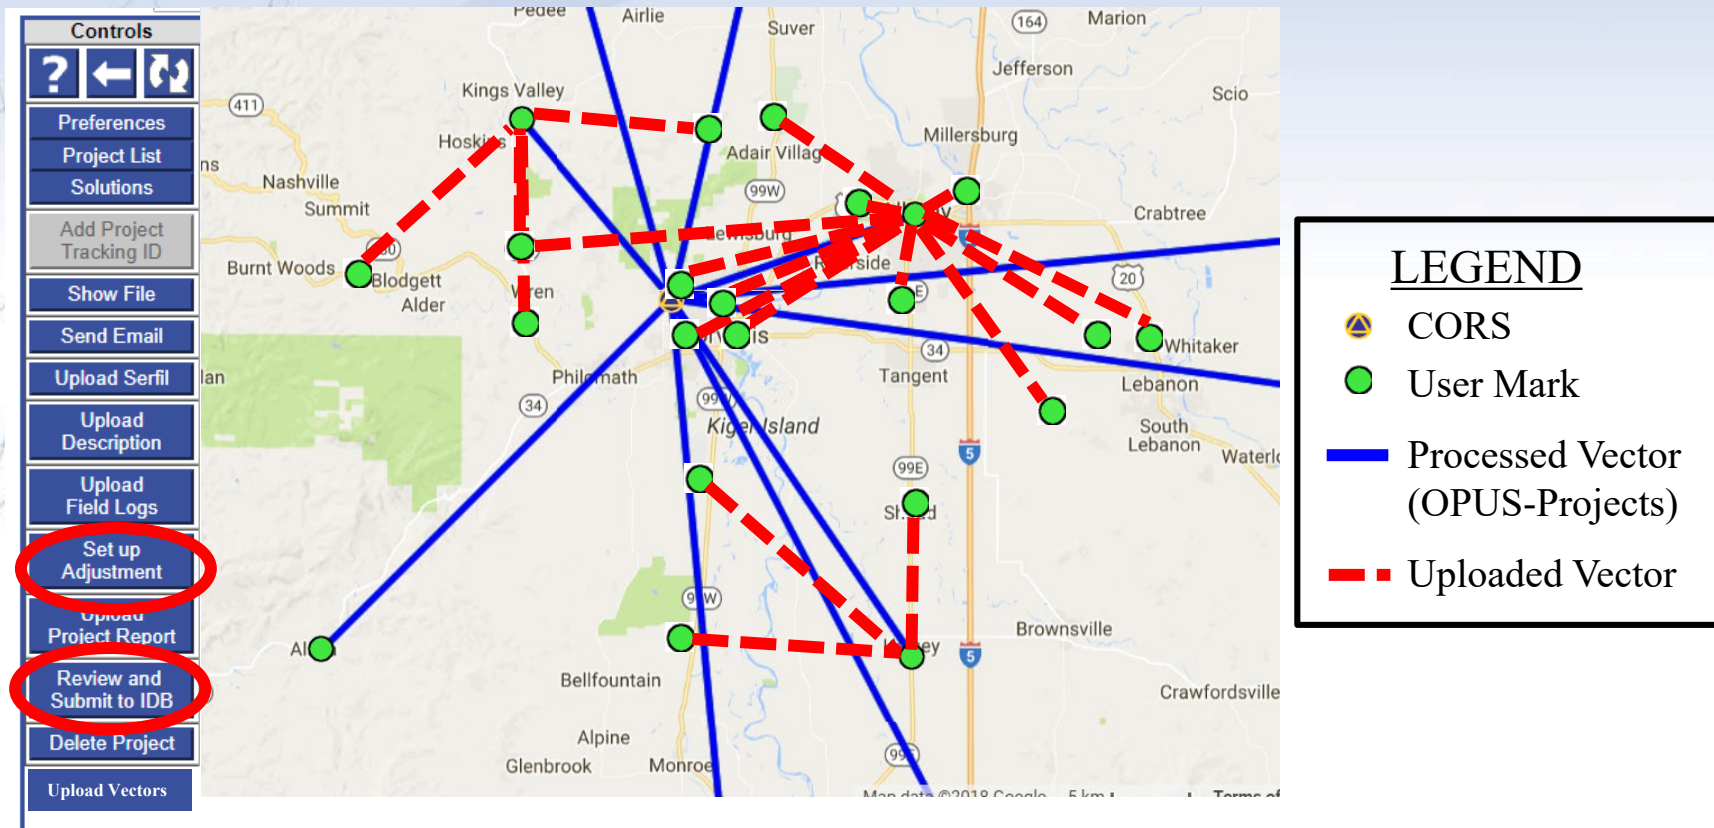

NSRS Coordinates or Not?

- No matter how you use OPUS, a user will always get coordinates with this label:
 - “These are **OPUS** coordinates”
- But depending on their choices for “control to use” and “epoch to adjust to”, they will get one of these two labels:
 - “These **are** tied to the NSRS”
 - “These **are not** tied to the NSRS”
- Let’s look at why...

GNSS Is Key

- Leveling can (and will) still tell you differential heights
 - But for OPUS to provide you absolute **NSRS coordinates**, you'll need to “get into the datum”
 - Trusted geodetic control:
 - Primary: New GNSS to get ellipsoid heights
 - » Maybe (still under consideration): “Recently” surveyed passive control
 - » Then GEOID2022 to get orthometric heights
 - Then pick an “appropriate” epoch for your adjustment
 - Now you're “in the datum”.

Example: Upload RTN Vectors to OPUS-Projects

Beta OPUS-Projects will accept RTK vectors starting in February 2021!

Leveling: NSRS coordinates or not?

Control used	Epoch of adjustment	Tied to the NSRS?
Passive control from the NSRS DB with RECs at the most recent reference epoch and/or SECs whose epoch falls after the most recent reference epoch	Any epoch from the most recent reference epoch (e.g. “2020.00”) until the midpoint epoch of the leveling campaign	Yes
Passive control from the NSRS DB <i>without</i> RECs at the most recent reference epoch <i>and without</i> SECs whose epoch falls after the most recent reference epoch	Any	No
Passive control where you have surveyed with GNSS using NGS’s latest GNSS w/ leveling specifications	Any epoch from the most recent reference epoch (e.g. “2020.00”) until the midpoint epoch of the leveling campaign	Yes
Passive control where you have surveyed with GNSS using NGS’s latest GNSS w/ leveling specifications	Any epoch before the most recent reference epoch	No
Anything else	Any other epoch	No

Conversion? Transformation?

Historically NGS has been inconsistent with these two words. Going forward, we will use them as:

- **Conversion**: Changing the type of coordinate without changing the datum or frame
 - e.g. change NAD 83(1986) **latitude and longitude** to NAD 83(1986) **State Plane Coordinates**
- **Transformation**: Changing the datum or frame, without changing the type of coordinate
 - e.g. changing an **NAD 27** latitude & longitude to an **NAD 83(1986)** latitude & longitude

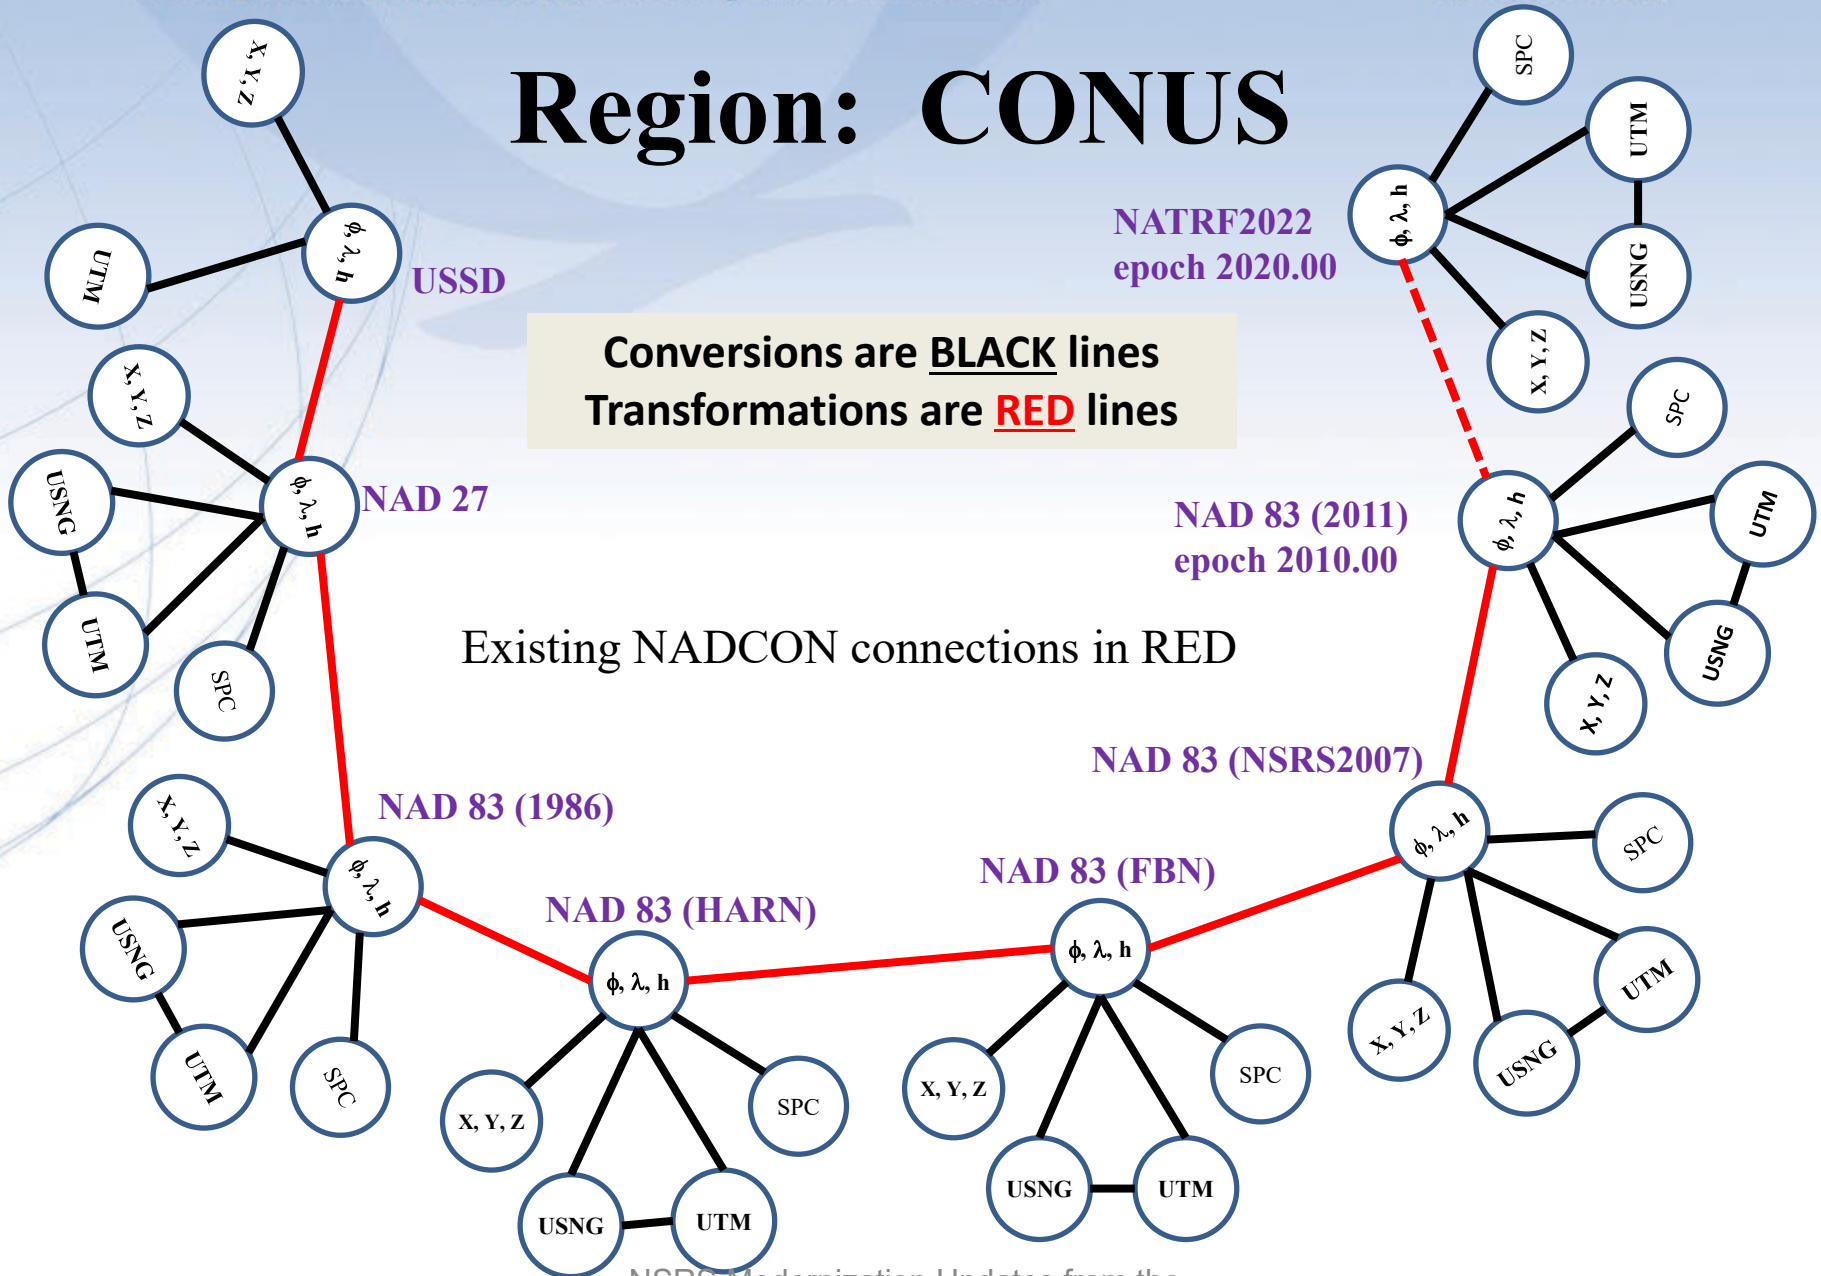

So, for example, “NADCON” which ***transforms*** coordinates between datums really should have been called “NADTRAN.” C’est la vie.

Conversions

- NGS has had many stand-alone computer programs for coordinate conversions.
- All of these are now integrated together inside NCAT (NGS Coordinate Conversion and Transformation Tool) – see later slides
- No datum changes are shown here

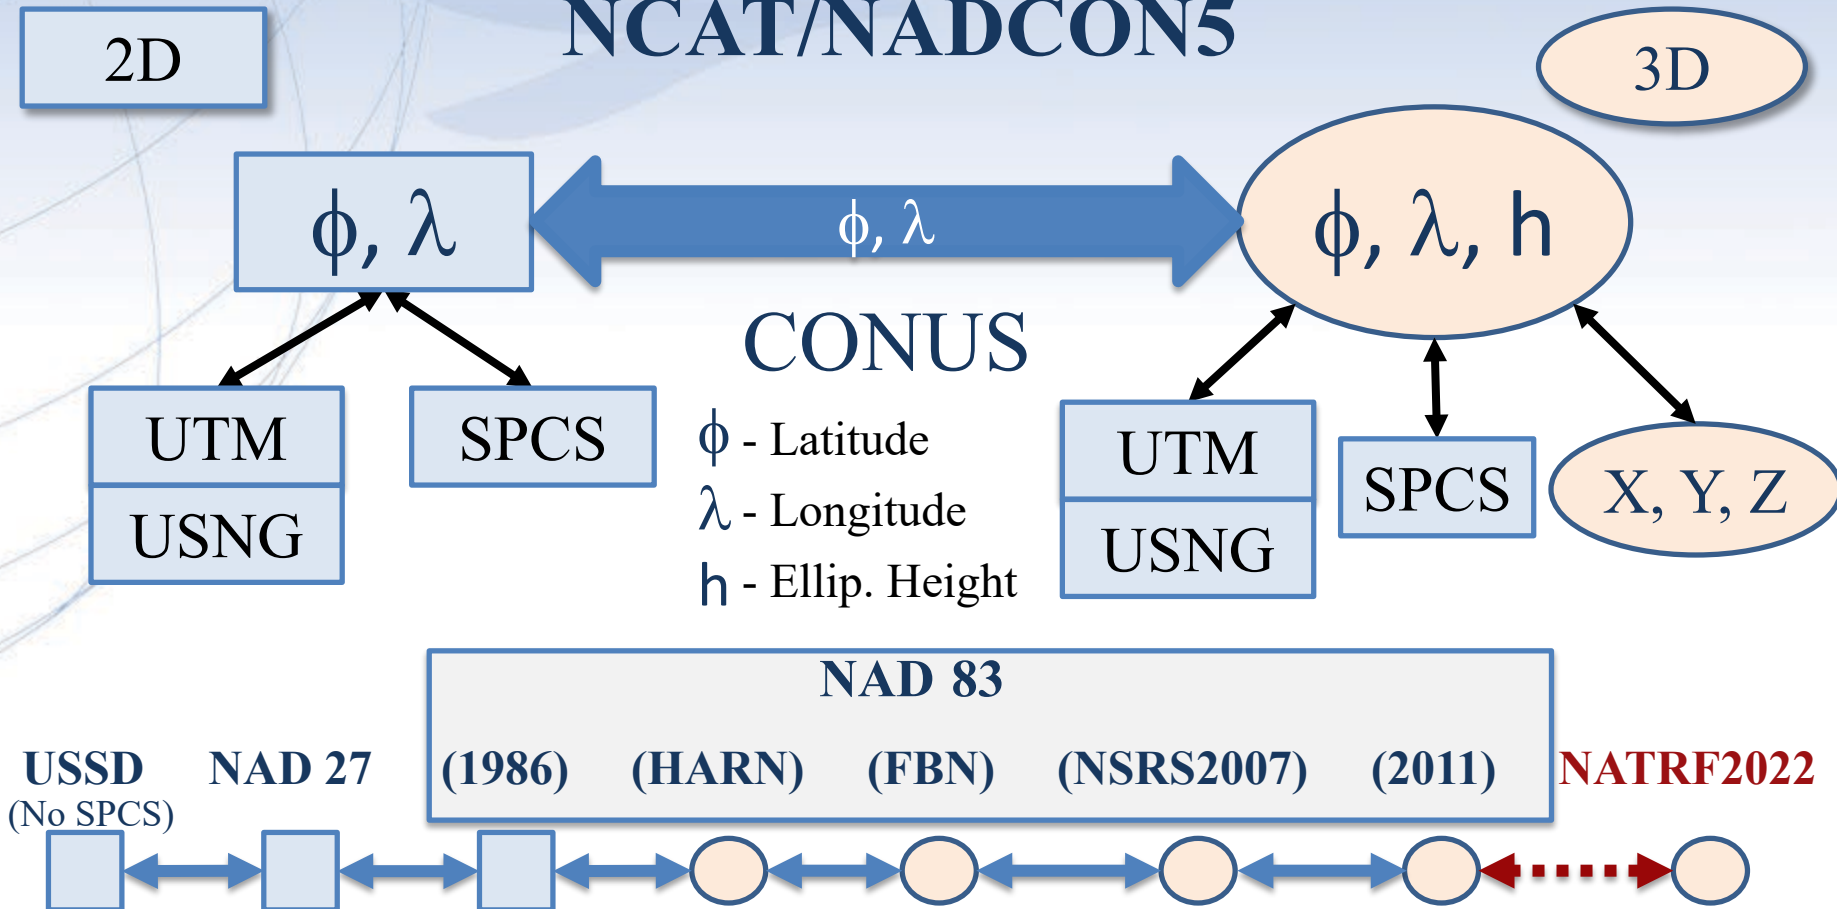

Region: CONUS

Transformations

NCAT/NADCON5

NCAT - with NADCON & VERTCON!

NGS Coordinate Conversion and Transformation Tool (NCAT)
National Geodetic Survey

NGS Home About NGS Data & Imagery Tools Surveys Science & Education Search

Single Point Conversion Multipoint Conversion Web services Downloads About Conversion Tool

Convert/Transform from: ☐ Horizontal ☒ Horizontal+height ☐ XYZ

Select the type of horizontal coordinate: ☒ Geodetic lat-long ☐ SPC ☐ UTM ☐ USNG

Select a height: ☒ Ellipsoidal ☐ Orthometric

 **UNITED STATES**

Enter lat-lon in decimal degrees
Lat: 39.2240867222
Lon: -98.5421515000

or degrees-minutes-seconds
Lat: N 39-13-26.71220
Lon: W 098-32-31.74540

or drag map marker to a location of interest

Ellipsoid Height (m):

Input reference frame (historically called 'horizontal datum'): NAD83(2011)

Output reference frame (historically called 'horizontal datum'): NAD83(2011)

Don't see a reference frame in the list? Click [here](#) to learn more.

SPC zone: Auto Pick (default zone)

Submit

Ways to Use NCAT

- Browser: Interactive, 1 point at a time
- Browser: Upload a file / get a file back (text, xlsx)
- As a Web Service
- Download and run locally
 - Beware: This works, but NCAT is updated frequently, so the copy you have may be outdated, so always download the latest version

NSRS MODERNIZATION EFFORTS

National Spatial Reference System (NSRS)

Geometric Geodesy

- Horizontal Datums/Geometric Reference Frames
- Latitude
- Longitude
- Ellipsoid Height
- State Plane Coordinates

Physical Geodesy

- Geopotential Datums
- Orthometric Height
- Dynamic Height
- Surface Gravity
- Leveling

Main Components: latitude, longitude, height, origin, scale, gravity, and orientation

Modernizing the NCN

- **Coordinate functions** are the way to know where a CORS is at the time you are trying to position yourself relative to that CORS
- They have been **discontinuous, piecewise linear** functions since the beginning
- NGS is developing newer, faster ways to update them when any of these occur:
 - An earthquake
 - An obvious drift of the station's daily-computed coordinates away from its own coordinate function
 - An obvious non-linear component to a station's movement

NCN Coordinate Functions

Note each piece is linear, but is offset from its neighboring piece. But at each unique time, there is one and only one “X” coordinate. This makes it a “function” by the strict mathematical definition.

NCN Coordinate Functions

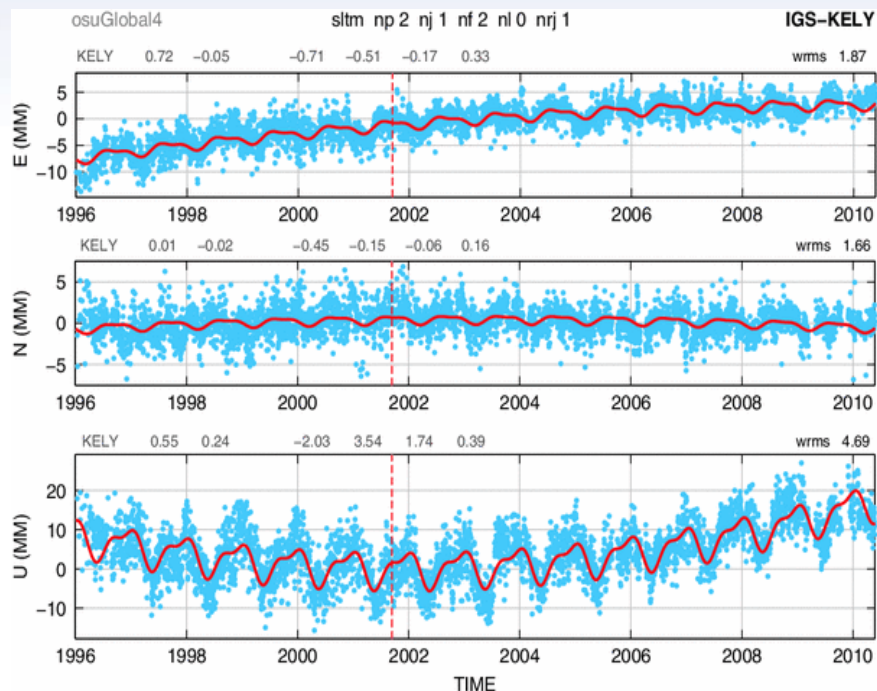

Today:

One coordinate, at one epoch,
and one velocity...

Modernized NSRS:

Examples of How Non-Linear CORS Coordinate Functions Might Look

Answers Being Developed...

- The NCN will be the primary access to the modernized NSRS
- This means every historic issue with the NCN to date must be, and *will be*, addressed
- A list of such issues follows

The NCN of the Future Will...

- Have a “CORS grading” system:
 - Quality and availability
 - To encourage use of “best” CORSs
- Address the difference between the one GRP and the many ARPs at each station
 - ARP: Comes and goes with every antenna
 - GRP: Permanent point on the station

The NCN – ARP/GRP issues

- The ARP is on the lowest non-removable plane of the antenna, usually coinciding with the axis of attachment
- The GRP is:
 - a unique point that is part of a particular station
 - the point to which any coordinate functions of the station refer.
 - identified by the operator of each station
 - (for a CORS) part of the fixed (=non-removable) part of the antenna mount

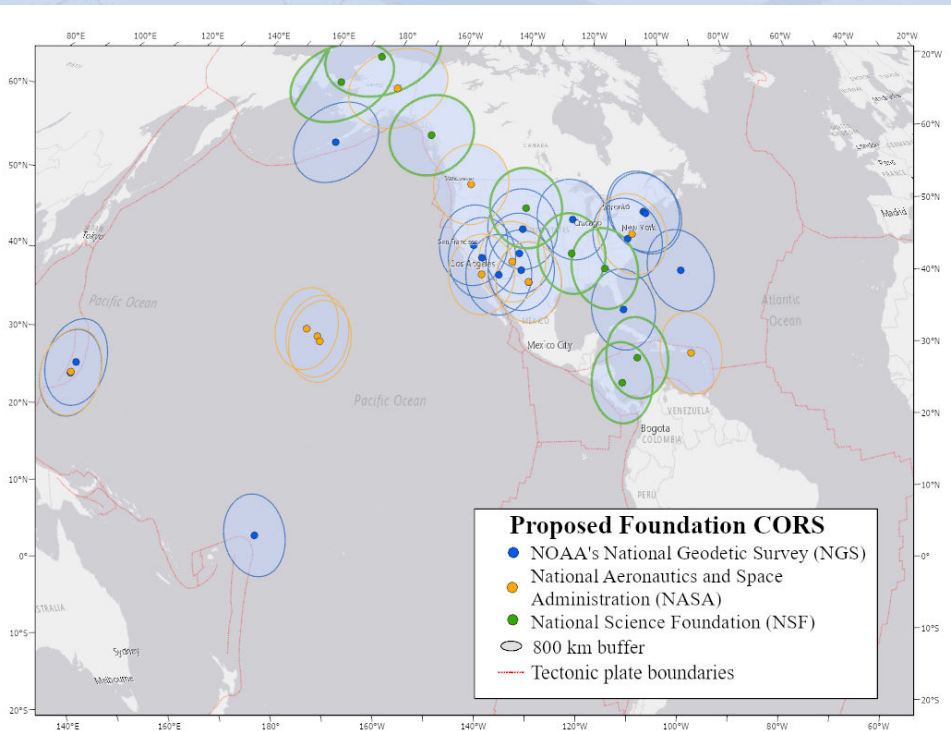

In this example, we find it convenient to identify the GRP as the point on the axis of attachment which will coincide with the lowest non-removable plane of the antenna when the antenna is mounted.

The NCN – ARP/GRP issues

- When the antenna goes away, so does the ARP
- Leaving the GRP

Program: NOAA CORS Network			

Three Ongoing Phases of Foundation CORS

Phase 1: Incorporate partner stations

Existing NASA and NSF stations brought into the Foundation CORS network.

*[NASA Agreement signed 12/18/2019.
Discussions ongoing with NSF.]*

Phase 2: Upgrade existing NGS CORSs

Upgrades include fully-GNSS (“All in Sky”) capable equipment, RINEX3 support, and submission to IGS.

[RINEX3 creation, ingestion, and QC in development.

5 of 7 NGS Foundation CORS are fully-GNSS enabled]

Phase 3: Construct ~9 new stations

These NGS-owned stations will be co-located at sites with existing space geodetic techniques

Foundation CORS at NGS' Table Mountain Geophysical Observatory in Boulder, CO, installed 2018 (ID: TMG2)

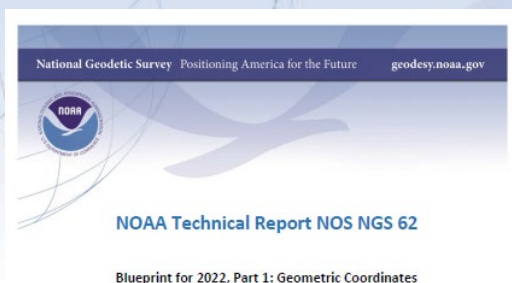

Updates

- The Blueprint documents contain some TBDs
 - They will be updated in 2021
- Additional information can be found by:
 - Subscribing to the *NSRS Modernization Newsletter*
 - Subscribing to the NGS Email Newsletters
 - Excellent way to learn when about new TRs and TMs

NEW TYPES OF COORDINATES

Embrace Time-Dependencies

- Coordinates Change
 - Even in so-called “plate fixed” frames
- Associate Coordinates with their **Survey Epoch**
 - Active control: daily computed coordinates
 - Fit a simple function to them through time
 - Currently linear. Non-linear in the future.
 - Passive Control: Coordinates only when the point was surveyed

New Types of Coordinates

NGS anticipates that 5 types of coordinates will be used in the NSRS. They are:

- Reported
- OPUS
- Survey Epoch
- Reference Epoch
- Active

New Types of Coordinates

- **Reported**
 - *“These are from any source where the coordinate is directly reported to NGS **without the data necessary for NGS to replicate the coordinate.**”*
 - Scaled from a map
 - Transformed using NCAT or VDatum
 - Smartphone
 - Reported directly from an RTK rover without data files

Reported Coordinates

Speaking of Smartphones...

NGS has a new mobile-friendly mark recovery webpage. Please try it out!

https://www.ngs.noaa.gov/cgi-bin/mark_recovery_form.prl

Buyer Beware!

- ***Reported*** coordinates might be *very* wrong!
 - Reported in NAD 27 or NAD 83 or WGS 84
 - Systematic Error: 2–100 meters
 - Scaled off of a USGS topographic map
 - Random Error: \pm 600 meters
 - Smartphone
 - Random Error: \pm 10–50 meters
- NGS ***will show you*** reported coordinates
 - But their function is to get you “in the neighborhood” of a mark, not to use as geodetic control!

New Types of Coordinates

- **OPUS**
 - “These are coordinates **at any epoch the user wishes to use** that have been computed by that user in OPUS”
 - User-computed values, such as they might get today from either OPUS-S or OPUS-Projects
 - “OPUS” coordinates are the **only** coordinates a user will get directly from OPUS
 - NGS will *not* evaluate your OPUS coordinates!

New Types of Coordinates

- **OPUS** coordinates may also come with the label “**tied to the NSRS**”
 - **Only** if a user restricts their computations to OPUS-recommended constraints
 - Users who deviate from OPUS-recommended constraints can still perform computations and will get OPUS coordinates, but they will not be “tied to the NSRS”, nor have any NSRS label at all.
 - In neither case will OPUS coordinates be considered “**part of the NSRS**” however.
 - That moniker is restricted to NGS-computed coordinates available from the NSRS database, such as **survey epoch coordinates** (SECs), **reference epoch coordinates** (RECs) and **active coordinates** (ACs). See next slides.

New Types of Coordinates

Reference epoch coordinates (RECs)

- *“These are coordinates which have been **estimated by NGS**, from time-dependent **age-limited** historic survey data, CORS coordinate functions and an intra-frame velocity model, **at an official NSRS reference epoch***

- NAD 83(2011) epoch 2010.00 (sort of) would've fallen under this category
- These will be computed by NGS every 5 years
 - On a schedule 2–3 years past the reference epoch
 - » 2020.00 coordinates are computed in CY 2022, etc

New Types of Coordinates

Survey epoch coordinates (SECs)

- *“These are coordinates computed by NGS using submitted data and metadata, checked and adjusted and **referenced to distinct epochs through time.**”*
 - These represent the best estimates NGS has of the time-dependent coordinates at any mark
 - Adjusting multiple surveys in timespans called “adjustment windows”, to a single epoch within that window.
 - Initial plan: 4 weeks for GNSS; 1 year for leveling

Pros and Cons

	Reference epoch (RECs)	Survey epoch (SECs)
Pros	<ul style="list-style-type: none">• Familiarity• Large point count	<ul style="list-style-type: none">• Shows, rather than hides, time dependency at marks• Easy to compute in a post-GPS era• Very accurate
Cons	<ul style="list-style-type: none">• Hard to compute• Requires an expensive IFVM• Perpetuates old way of using geodetic control• Hides time dependency of marks• Inaccuracies build up based upon the large number of assumptions used	<ul style="list-style-type: none">• Lack of familiarity by users• Will require significant effort to compute pre-GPS era absolute values

More on SECs and RECs

- At passive control
- SECs: adjusted to a midpoint epoch near the survey
 - (4 weeks for GNSS; 1 year for leveling; etc)
- RECs: adjusted to a ref. epoch (2020.00, etc.)
- REC adjustments will include:
 - Some *age-limited* span of data
 - If that age-limit were 10 years prior and 2 years post R.E....
 - Then 2020.00 RECs come from data spanning 2010.00 to 2021.99999
 - Exact age-limit won't be known until we start experimenting in 2022 with the 2020.00 REC adjustments

Time limits on reference epoch coordinates

We invite you to try out our new beta eCFR site at <https://ecfr.federalregister.gov>. We've made big changes to make the eCFR easier to use. Be sure to leave feedback using the 'Help' button on the bottom right of each page!

Dates:
The effective date of this announcement is upon publication of this notice. Submission of GNSS observations or geodetic

New Types of Coordinates

Active coordinates (ACs)

- *Not discrete, but rather a function through time assigned to some point*
 - At a CORS GRP*, they will be the *coordinate function*
 - Which will be generated by a “fit” to regularly computed coordinates on a TBD basis, perhaps daily, perhaps weekly
 - » These daily or weekly coordinates will not generally be used as geodetic control by themselves

* Recall this is the physical point to which coordinates refer at a station like a CORS

CORS Coordinate Functions... (AKA “Active coordinates”)

```
← ⓘ ftp://www.ngs.noaa.gov/cors/coord/coord_08/pin1_08.coord.txt

***IGS 08***
PINON 1 PGGA (PIN1), CALIFORNIA
Created on 31Aug2011 at 09:30:45.

-----
Antenna Reference Point (ARP): PINON 1 PGGA CORS ARP
-----
PID = AF9708

IGS08 POSITION (EPOCH 2005.0)
Computed in Aug 2011 using data through gpswk 1631.
X = -2369511.285 m latitude = 33 36 43.76186 N
Y = -4761208.286 m longitude = 116 27 29.37473 W
Z = 3511397.204 m ellipsoid height = 1257.901 m

IGS08 VELOCITY
Computed in Aug 2011 using data through gpswk 1631.
VX = -0.0231 m/yr northward = 0.0076 m/yr
VY = 0.0151 m/yr eastward = -0.0274 m/yr
VZ = 0.0070 m/yr upward = 0.0012 m/yr
```

A typical “CORS
coordinate
file” available from NGS

Just one set of
coordinates
and *just one* set of
velocities are given...

...while this is good and
useful information, it
hides the true nature of
the coordinate function.

New Database

- Currently: The NGS Integrated Database (IDB)
 - “Integrated” because it combined the old Horizontal and Vertical databases
- Future: The NSRS Database
 - Time-Dependent, Geospatial

Coordinates

- Five types:
 - **Survey Epoch:** “Time dependent coordinates”
 - **Reference Epoch:** “Estimated at 2020, 2025, 2030, ...”
 - **Reported:** Good for finding a point somewhere on Earth.
 - Not to be used as geodetic control
 - **OPUS:** Computed by you, and as accurate or inaccurate as the choices you make
 - Tied to the NSRS if you follow OPUS recommendations
 - **Active:** Continuous functions at a CORS

State Plane Coordinates System of

- See SPC details

Vonderohe and Dan Rodman

20. Wisconsin's Piece of the State Plane Coordinate System of 2022 (SPCS2022): Practical Aspects of Adoption of New Reference Frames, Datums, and Coordinate Systems

Dan Rodman, PLS, City of Madison Parks Division, Madison, Wis. and Alan Vonderohe, Professor Emeritus of Civil and Environmental Engineering, University of Wisconsin-Madison, Madison, Wis.

2.0 PDHs, Category 1 or 3

Survey requests, proposals, and designs for two 'layers' of map projections to be included in the new State Plane Coordinate System. A statewide single zone, as well as a new set of low-distortion projections (LDPs), similar but not identical to WISCRS, will be described. Practical considerations, from a surveyor's and spatial data manager's perspective, of implementing the new coordinate systems and their underlying new reference frame will be described with examples of potential coordinate differences and alternatives for dealing with them.

2) Procedures for

[policy.shtml](https://geodesy.noaa.gov/policy.shtml)

requested and

in 2021

after official

Alan

Bye, bye, U.S. survey foot...

- In modernized NSRS, NGS will support only one definition of the “foot”
 - Previously called the “international foot”
 - Now, just the “foot”
 - 1 foot = 0.3048 meter (exact)
- *However*
 - Recommend using term “international foot” when there is potential for confusion with other foot
 - NGS will continue to support U.S. survey foot for legacy applications (e.g., SPCS 83 and 27)

HOW YOU CAN CONTRIBUTE

GPS on Bench Marks:

Crowdsourcing Data for Better Models and Tools

NGS provides a prioritized list of marks where new data will most benefit the local accuracy of national scale models and tools such as GEOID18 and the 2022 Transformation Tool

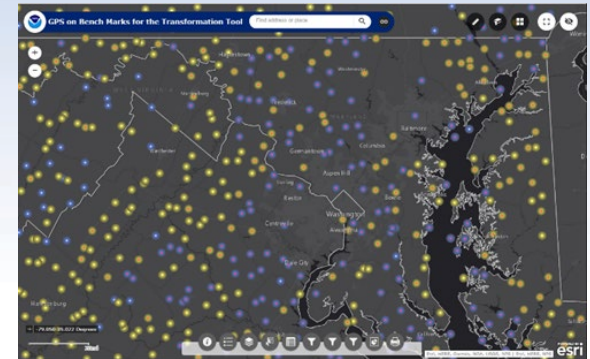

Who: Federal and State government agencies, universities, and private sector firms

What: Mark Recovery Reports & Sharing GPS Observations

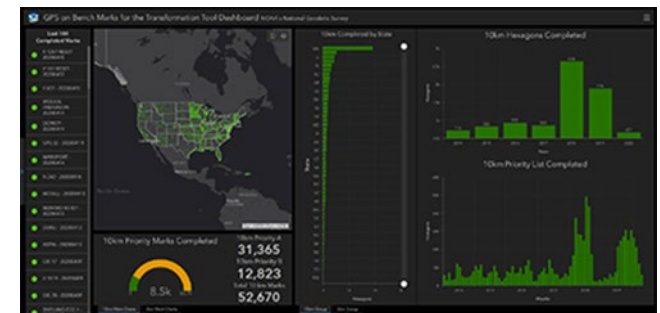

2022 Transformation Tool Campaign

National Coverage @ 10km spacing – ideal resolution for data to develop a national scale transformation tool

Local Densification @ 2km spacing – Allows partners to collect higher density data and increase local accuracy in areas they work

Priority Marks Web Map

Transformation Tool Campaign Progress Dashboard

GPSonBM: 2022 Transformation Tool Campaign

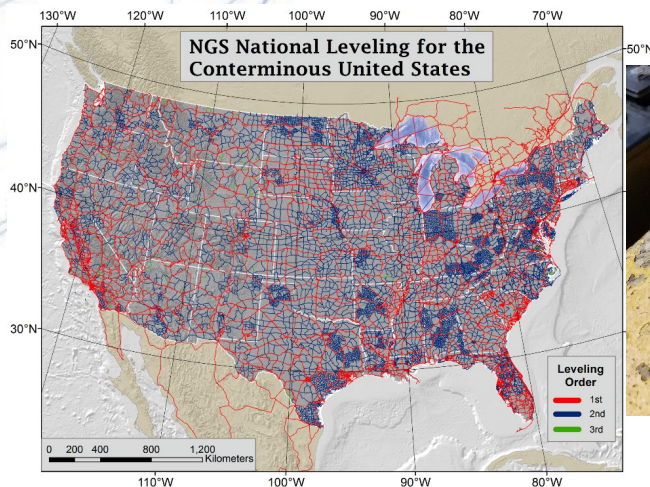

NGS' GPSonBM program is now requesting data to build the models that NCAT and VDatum will use to transform geospatial data from existing datums to the Modernized National Spatial Reference System

The screenshot shows the NGS Coordinate Conversion and Transformation Tool (NCAT) interface. The header includes the NOAA logo and the title "NGS Coordinate Conversion and Transformation Tool (NCAT)". Below the header is a navigation bar with links: "NGS Home", "About NGS", "Data & Imagery", "Tools", "Surveys", "Science & Education", and "National Geodetic Survey". The main content area has tabs for "Single Point Conversion", "Multipoint Conversion", "Web services", "Downloads", and "About Conversion Tool". The "Single Point Conversion" tab is active. It features a "Convert from:" section with radio buttons for "LLH", "SPC", "UTM", "XYZ", and "USNG". The "LLH" option is selected. Below this are input fields for "Lat:" and "Lon:" with a "Convert" button. A map of the United States is shown on the right. The "Input datum" is set to "NAD83(2011)" and the "Output datum" is also set to "NAD83(2011)".

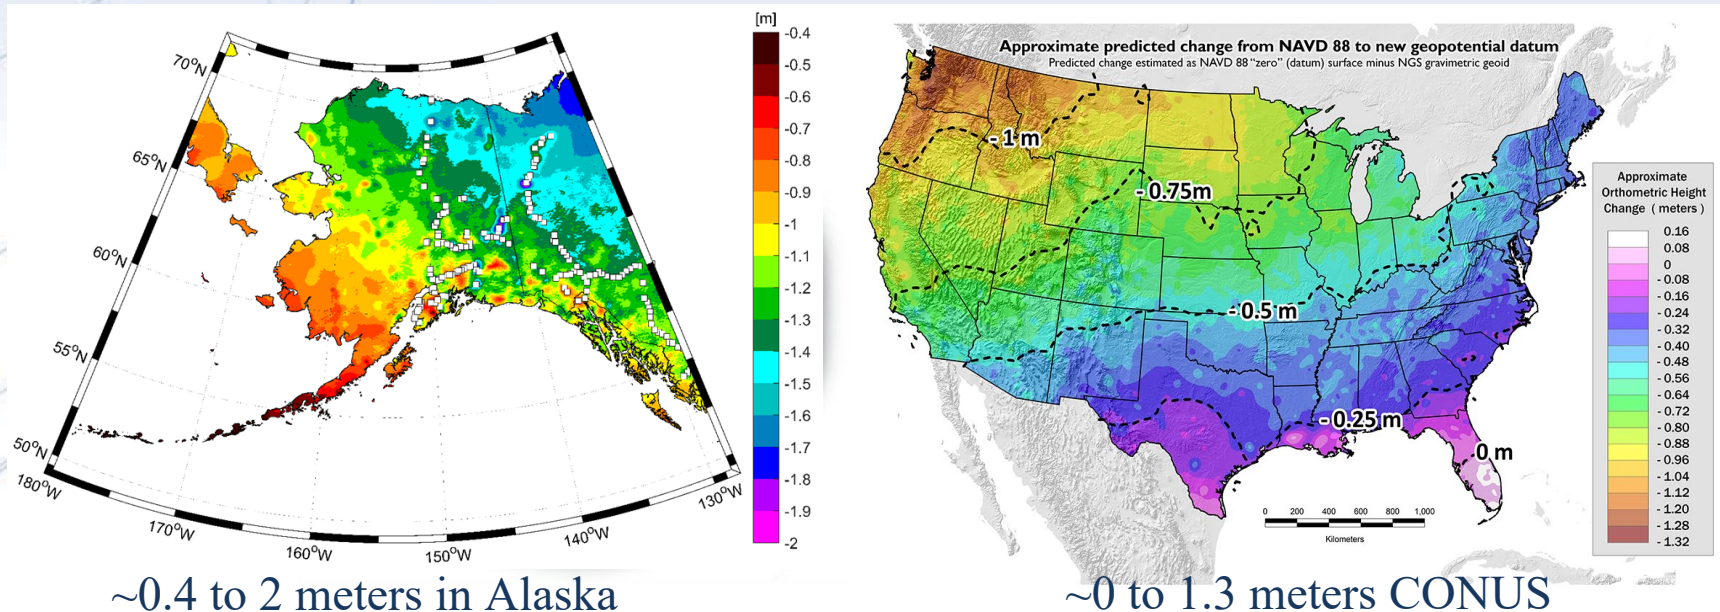

The screenshot shows the NOAA National Oceanic and Atmospheric Administration (NOAA) Online Vertical Datum Transformation (VDatum) interface. The header includes the NOAA logo and the title "ONLINE VERTICAL DATUM TRANSFORMATION". Below the header is a navigation bar with links: "Home", "About VDatum", "Download", "Docs & Support", and "Contact Us". The main content area has a "Horizontal Information" section with "Source" and "Target" columns. The "Source" column has a "Reference Frame" dropdown set to "NAD83(2011)/CORS96(HARN) - North American tech", a "Coord. System" dropdown set to "Geographic (Longitude, Latitude)", a "Unit" dropdown set to "meter (m)", and a "Zone" dropdown. The "Target" column has a "Reference Frame" dropdown set to "NAD83(2011)/CORS96(HARN) - North American tech", a "Coord. System" dropdown set to "Geographic (Longitude, Latitude)", a "Unit" dropdown set to "meter (m)", and a "Zone" dropdown. Below this is a "Vertical Information" section with a "Source" and "Target" column. The "Source" column has a "Reference Frame" dropdown set to "NAVD 88", a "Unit" dropdown set to "meter (m)", and a "GEOID model" dropdown. The "Target" column has a "Reference Frame" dropdown set to "NAVD 88", a "Unit" dropdown set to "meter (m)", and a "GEOID model" dropdown. There are also radio buttons for "Height" and "Sounding" and a "Convert" button.

GPSonBM Connects Old & New Datums

Because the relationships between the old and new datums vary by location, the accuracy of the transformations in any particular place is directly related to the density of GPSonBM data available in that area.

Approximate Predicted differences between Old & New: NAVD 88 minus NAPGD2022

GPSonBM data collection efforts are focused on the vertical datum transformations to resolve the irregular relationship between the surfaces. Horizontal transformations are smooth and will be done primary with CORS data.

Recover

NGS has a new mobile-friendly mark recovery webpage. Please try it out!

https://www.ngs.noaa.gov/cgi-bin/mark_recovery_form.prl

Observe

- 4+ hour static occupation
- **Take photos** of the mark (close up and eye level), take one horizon photo (preferably facing south) and note any changes to the existing mark description.
- Fixed height tripod recommended

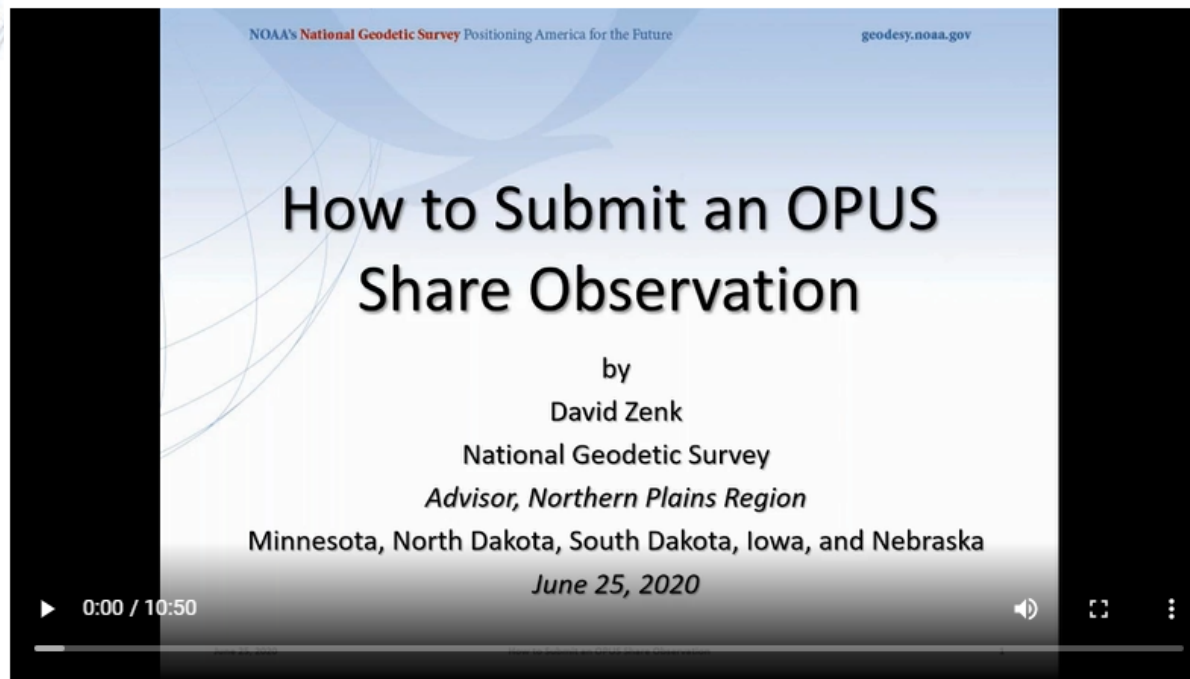

Report using OPUS Share

NSRS Modernization: DELAY

- It's official: we are delayed beyond 2022
- On June 23, 2020, this message was rolled out via:
 - NGS Web Page
 - *NSRS Modernization News* Special Issue
 - Granicus Announcement
 - Notifications to NSPS, AAGS, FGDC/FGCS

NSRS Modernization: DELAY

A list of FAQs is available. Some summary highlights:

– **Why are we delayed?**

- GRAV-D issues (COVID-19, airspace, unforeseen maintenance)
- Personnel issues (Losses, hiring issues)

– **How long is the delay?**

- Unknown. Years.

– **Will names change?**

- No, “GEOID2022”, “NATRF2022”, etc. will remain the same

NSRS Modernization: DELAY

What now?

- A re-prioritization of all modernization tasks was done
- Efforts on getting tasks completed in a logical order that builds one upon the next
 - To allow us the choice, if we wish, to phase the modernization roll-out:
 - For example, rolling out NATRF2022 before NADCON exists
 - For example, rolling out NATRF2022 before NAPGD2022
 - BUT phased roll-out isn't on the table yet
- No deadlines slip.
 - GPS on BM , SPCS , etc.
 - Steady as she goes...

Summary

- Your NAD 83 coordinates may change by 2–4 meters
- Your orthometric heights may change by up to 2 meters (or more)
- Magnitude of change will vary with location:
 - NAD 83 will change by about 0.5 to 4 meters horizontally
 - Orthometric and NAD 83 ellipsoid heights will change by up to about 2 meters
- And that just gets you to a “reference epoch”
 - Which continues to perpetuate the “one coordinate in perpetuity” myth
 - After that, real motions kick in and become part of the world of geodetic control

Summary

- But it's not all “change”...
 - You will still be able to:
 - Get a position using OPUS
 - Adjust your projects to some reference epoch
 - Look at a mark's “datasheet”
 - Only now, there will be a lot more information and a lot more service provided

Closing

- Surveying will still be surveying
- Just because NGS provides time-dependent information doesn't mean everything you do has to be "time dependent"
 - NGS will provide tools to minimize its impact:
 - Plate fixed frames
 - Reference epoch coordinates

Closing

- But if time-change is important (heights in coastal subsidence zones, anyone?) they are available
 - Survey epoch coordinates will show a mark's coordinate history
 - The IFVM will be broadly useful for showing movement in the horizontal, but significantly less so in the vertical

Numerical_Title	Date(s)	Title	Author(s)	Link
NOAA Technical Report NOS NGS 74	2020	A GPS Based Estimate of the Rotation of the Mariana Plate in Both ITRF2008 and ITRF2014	Dru Smith	PDF
NOAA Technical Report NOS NGS 73	2020	Primary and Secondary Adjustments of Leveling Observations to Establish a Consistent Vertical Datum Tied to Local Mean Sea Level for Oahu, HI	Daniel R. Roman	PDF
NOAA Technical Report NOS NGS 72	2020	GEOID 18	Kevin Ahlgren, Galen Scott, David Zilkoski, Brian Shaw, Nagendra Paudel	PDF
NOAA Technical Report NOS NGS 65	2020	The National Adjustment of 2011 Alignment of Passive GNSS Control with the Three Frames of the North American Datum of 1983 at Epoch 2010.00: NAD83 (2011), NAD83 (PA11), and NAD83 (MA11)	Michael L. Dennis	PDF
NOAA Technical Memorandum NOS NGS 86	2020	Quantifying Systematic Error When Using Axial Rotation Rates Rather Than Geographic Euler Pole Parameters When Describing Tectonic Plate Rotation	Dru Smith	PDF
NOAA Technical Memorandum NOS NGS 85	2020	On the Propagation of Formal Error Estimates of Euler Pole Parameters into Modernized NSRS Coordinates	Dru Smith	PDF
	2020	Biquadratic Interpolation	Dru Smith	PDF
NOAA Technical Memorandum NOS NGS 83	2020	Exploring and Quantifying the Contribution of Linear Coordinate Functions at NOAA CORS Network Stations to the 2022 Intra-Frame Velocity Model: An Experiment	Dru Smith	PDF
NOAA Technical Memorandum NOS NGS 82	2020	On the Use of Linear Units as a Companion to Horizontal Datum Transformations Performed on Curvilinear Coordinates	Dru Smith, Michael Dennis	PDF

Does anyone *really* re-survey points?

Does anyone *really* re-survey points?

Does anyone *really* re-survey points?

Geoid-Based Vertical Datum

	Passive Control	Geoid-Based / GNSS accessed
Available everywhere?	No	Yes
Safe from being bulldozed?	No	Yes
Accurate to a few cm everywhere?	No	Yes
Differentially accurate to few mm < 50 km?	Yes	No
Differentially accurate to few mm 50-200 km?	Yes	Yes
Differentially accurate to few mm > 200 km?	No	Yes
Change to the way people do business?	No	Yes
Fast?	No	Yes

GPS vs Leveling...
