

InfraMarker® & ESRI

Better asset management with RFID

Improve field operations with ArcGIS and InfraMarker

Infrastructure managers work to simplify and enhance field operations. InfraMarker leverages the power of RFID technology and ESRI's field data collection tools to streamline field processes.*

With the InfraMarker solution, a simple RFID scan will:

- Display asset information written to the RFID marker
- Launch the asset's associated inspection forms from the ESRI feature service
- Optimize GIS systems in the field and simplify asset verification

InfraMarker RFID-embedded products are designed for fast and reliable marking of infrastructure assets including hydrants, inlets and manholes – even subsurface utilities such as splices and valves.

Coupled with ESRI's tools, InfraMarker's RFID hardware and software integrate into existing operations while delivering fast and accurate performance in the field.
