

## Using Moisture Absorbing Hangers in Your Room

### Why do we need these?

These will help reduce the moisture in your room. Excess moisture in your room can cause growth/mold.

### Where do I place them in the room?

The best place to hang these is in the open if possible.

### What happens when they are full?

Submit a work order to have it removed and a new one installed.

### How do they work?

The moisture absorbing hanger uses crystals that are exposed to air, they absorb excess moisture and gradually dissolve into a liquid brine (a saltwater solution). They will not dry the air to a level that damages plants or clothing.

## Hangers work in three phases:

<b>Phase 1</b>	These crystals work immediately to absorb excess moisture from the air. The crystals harden and form a solid mass. Then they begin to dissolve, and liquid will begin to drip into the bottom of the bag. It may take a few days before liquid begins to drip.
<b>Phase 2</b>	Accumulated moisture will drip into the bottom of the bag, and about half to three-quarters of the crystals will dissolve.
<b>Phase 3</b>	All the crystals will dissolve, and the bottom of the bag will be full of liquid.
<b>Clean Up</b>	In case of spills, flush area with water and soak up with a sponge or towel. Clothes should be laundered as normal.
